AMENDED REPORT ON THE RESULTS OF OPERATIONS

APPLE VALLEY RANCHOS WATER COMPANY

Test Year 2015 and Escalation Years 2016 and 2017
Application 14-01-002

For authority to increase water rates located in the Community of Apple Valley, including Jess Ranch, located in San Bernardino County

San Francisco, California
May 19, 2014
# TABLE OF CONTENTS

EXECUTIVE SUMMARY .............................................................................................................. 2

CHAPTER 1: INTRODUCTION & SUMMARY ............................................................................. 1-1
A. INTRODUCTION .................................................................................................................. 1-1
B. DISCUSSION .......................................................................................................................... 1-1
   1) AVR – Domestic ............................................................................................................. 1-1
   2) AVR – Irrigation .......................................................................................................... 1-2
C. CONCLUSION ....................................................................................................................... 1-2

CHAPTER 2: WATER CONSUMPTION AND OPERATING REVENUES ...................................... 2-1
A. INTRODUCTION .................................................................................................................. 2-1
B. SUMMARY OF RECOMMENDATIONS .................................................................................. 2-1
C. DISCUSSION .......................................................................................................................... 2-2
   1) Customers ....................................................................................................................... 2-3
      a) Residential .................................................................................................................. 2-3
      b) Business/Commercial ............................................................................................... 2-3
      c) Industrial, Public Authority – Irrigation, Gravity Irrigation, Apple Valley Golf Course, and Public Authority .............................................................................. 2-4
      d) Private Fire .................................................................................................................. 2-4
      e) Pressure Irrigation ....................................................................................................... 2-4
      f) Temporary Construction ............................................................................................ 2-4
   2) Water Sales Per Customer .............................................................................................. 2-5
      a) Residential and Business/Commercial ........................................................................ 2-5
      b) Industrial, Public Authority, Private Fire, Public Authority Irrigation, Pressure Irrigation, Apple Valley Golf Course, and Temporary Construction ........................................................................... 2-6
   3) Unaccounted for Water .................................................................................................... 2-7
   4) Operating Revenue ......................................................................................................... 2-8
D. CONCLUSION ....................................................................................................................... 2-8
CHAPTER 3: OPERATIONS AND MAINTENANCE, ADMINISTRATIVE AND GENERAL EXPENSES ..................................................... 3-1

A. INTRODUCTION ........................................................................................................... 3-1

B. SUMMARY OF RECOMMENDATIONS ........................................................................ 3-1

C. DISCUSSION .................................................................................................................. 3-1

1) Operations Payroll ...................................................................................................... 3-2
2) Operations – Other ..................................................................................................... 3-2
3) Purchased Power ........................................................................................................... 3-3
4) Leased Water Rights .................................................................................................. 3-3
5) Replenishment .............................................................................................................. 3-4
6) Chemicals ...................................................................................................................... 3-4
7) Payroll - Customers .................................................................................................... 3-5
8) Customers - Others ..................................................................................................... 3-5
9) Payroll Maintenance ................................................................................................... 3-5
10) Maintenance - Other .................................................................................................. 3-5
11) Payroll – Clearings .................................................................................................... 3-5
12) Depreciation – Clearings ........................................................................................... 3-5
13) Clearings – Other ........................................................................................................ 3-5
14) Uncollectibles .............................................................................................................. 3-6
15) Conservation ................................................................................................................ 3-6
   a) Conservation Estimates ............................................................................................ 3-6
   b) Conservation Balancing Account .............................................................................. 3-9
16) A&G Payroll ................................................................................................................ 3-10
17) Employee Benefits ..................................................................................................... 3-10
18) Insurance ..................................................................................................................... 3-11
19) Uninsured Property Damage Expense ...................................................................... 3-11
20) Regulatory Commission Expense ............................................................................. 3-12
21) Franchise Requirements ............................................................................................ 3-13
22) Outside Services ......................................................................................................... 3-13
   a) Arc Flash Hazard Assessment, the Vulnerability/Mitigation Study for Natural Disasters, and the Water Supply Evaluation portions from Safety Consulting...................................................................................................................... 3-14
b) Public Relations Consulting and 360 degree Leadership Feedback .............................................................. 3-15

23) A&G - Other ................................................................................................................................. 3-15
24) A&G Transferred .......................................................................................................................... 3-18
25) Rents ............................................................................................................................................. 3-18
26) General Office Allocation ............................................................................................................ 3-18

D. CONCLUSION ............................................................................................................................. 3-19

CHAPTER 4: PAYROLL ......................................................................................................................... 4-1
A. INTRODUCTION .............................................................................................................................. 4-1
B. SUMMARY OF RECOMMENDATIONS ............................................................................................ 4-1
C. DISCUSSION .................................................................................................................................. 4-2
   1) AVR’s Payroll Requests ................................................................................................................ 4-2
      a) AVR’s Payroll Methodology ................................................................................................ 4-2
      b) Labor Escalation Rates ............................................................................................................ 4-3

CHAPTER 19: WATER REVENUE ADJUSTMENT MECHANISM/MODIFIED COST BALANCING ACCOUNT .............................................. 19-1
A. INTRODUCTION ...................................................................................... 19-1
B. SUMMARY OF RECOMMENDATIONS .................................................... 19-1
C. DISCUSSION .......................................................................................... 19-2
   1) Commodity revenues and production costs for irrigation-
      gravity should not be tracked in the WRAM/MCBA ...................... 19-2
   2) Incremental Cost Balancing Account Should Continue ................ 19-4
   3) Chemical Costs Should Not Be Included in the MCBA ................. 19-4
4) Five Options related to WRAM/MCBA in Decision 12-04-048 ............ 19-5
5) Are the WRAMs/MCBAs achieving their stated purpose? ............... 19-6
6) Have the WRAMs/MCBAs removed disincentives to implement conservation rates and conservation program? .................. 19-7
7) Have cost savings resulting from conservation been passed onto ratepayers? ............................................................... 19-7

D. CONCLUSION ........................................................................................................... 19-8

APPENDIX A – ORA RESULTS OF OPERATIONS TABLES
APPENDIX B – QUALIFICATIONS
MEMORANDUM

This Report is prepared by the Office of Ratepayer Advocates (ORA) – Water Branch. Senior Utilities Engineer Yoke Chan serves as Project Coordinator, under the supervision of Program and Project Supervisors Ting-Pong Yuen and Lisa Bilir and Project Manager Danilo Sanchez. Maria Bondonno serves as ORA legal counsel in this general rate case. The list of ORA witnesses and their contributions to this report are listed in Executive Summary. Appendix A of this report contains ORA’s Results of Operations Tables and Appendix B contains the Qualifications and Prepared Testimony of ORA witnesses.
EXECUTIVE SUMMARY

In its Application 14-01-002, filed on January 2, 2014, Apple Valley Ranchos Water Company (AVR) requests a rate increase of 14.88% in Test Year 2015, 8.48% in Escalation Year 2016, and 8.19% in Escalation Year 2017. ORA in this report presents its analysis and recommendations that result in an estimated increase of 7.97% in the Test Year 2015, and an estimated increase of 2.99% in Escalation Year 2016.

Key Recommendations

ORA recommends that AVR’s rate of return of 9.07%, adopted in Decision 13-05-037 be used in this proceeding.

ORA recommends that the Commission adopt ORA’s results of operations for AVR (domestic & irrigation) which are based on lower estimates for O&M expenses, A&G expenses, plant additions and ratebase, and lower sales estimates.

Some of ORA’s key adjustments are:

- Lower sales and lower unaccounted for water percentage. (See Chapter 2).
- O&M and A&G Expenses: Lower leased water rights expenses,
- Lower Pensions and Benefits Expenses. (See Chapter 5).
- Plant Investment and Rate Base: Disallowance and/or reduction of various plant investment requests (e.g., new well #35, 1.5 MG storage tank in Bell Mountain pressure zone and Stoddard pressure zone, and office expansion and mains replacement program). AVR’s plant addition estimate for 2014, 2015 and 2016 exceeds ORA’s estimates by 55%, 29%, and 27% respectively. (See Chapter 8).

ORA recommends that the Commission to allow AVR to track conservation expenses in a capped One-Way Balancing Account for the three years of this GRC cycle. (See Chapter 3.)
ORA recommends that the Commission adopt ORA’s estimates for Park Water Company’s (“Park”) general office expenses and rate base and the allocation of those components to Park’s division/subsidiaries which include AVR (domestic and irrigation). (See Chapter 12.)

ORA does not oppose AVR’s requests to amortize the balances in its existing balancing accounts and memorandum accounts with a few exceptions. (See Chapter 14.)

ORA recommends AVR’s special requests be granted in part and denied in part. (See Chapter 15.)

ORA recommends that AVR continue its pilot conservation rate design program and that AVR’s proposed modifications to the tier breakpoints and price differential between tiers be adopted. (See Chapter 16.)

ORA does not oppose AVR’s request to increase to LIRA discount and related surcharge amount. (See Chapter 18.)

ORA recommends AVR’s requests be denied for the following: (1) add the commodity revenues for the irrigation-gravity customer group to the WRAM balancing account, (2) add the irrigation-gravity production costs to the MCBA, (3) terminate the Incremental Cost Balancing Account on the effective date of tracking irrigation-gravity water costs in the MCBA, and (4) add the cost of chemicals to the supply costs captured by the MCBA. (See Chapter 19.)

**Compliance Matters**

AVR included the refunds for the salaries for unfilled positions in its 2013 WRAM/MCBA balance. The advice letter for recovering 2013 WRAM/MCBA was filed on May 6, 2014.

AVR is not in compliance with D. 12-09-004 with presenting a detailed study and testimony to justify its total compensation package for all levels of workers in terms of both the local Apple Valley labor market as well as the water industry in California. (See Chapter 4.)

CHAPTER 1: INTRODUCTION & SUMMARY

A. INTRODUCTION

AVR estimates that its proposed increases will produce revenues providing a rate of return on equity ("ROE") of 9.79% and a rate of return on ratebase ("ROR") of 9.07%. These rates of return were authorized by the Commission in D.13-05-027.

This report sets forth ORA’s analysis and recommendations on AVR’s general rate case requests. Tables 1-1 through 1-3 in Appendix A compare AVR’s and ORA’s Summary of Earnings for the Domestic System for the Test Year 2015. Table 1-4 compares AVR’s and ORA’s Summary of Earnings for the Irrigation System for Test Year 2015.

B. DISCUSSION

AVR operates two water systems - domestic and irrigation, each having its own results of operations ("RO"). AVR’s domestic system generates about $20 million in annual revenues and has 24 wells and 19,000+ customers. Its irrigation system generates approximately $197,000 in annual revenues, and has one well and one customer. This one well pumps into a series of lakes, from which the customer takes metered lake water to irrigate a golf course.¹

1) AVR – Domestic

Table 1-A below provides a comparison of AVR’s and ORA’s estimated domestic revenue requirement increases for Test Year 2015, both based on a

¹ AVR Revenue Requirement Report, p. 6.
9.07% ROR. The differences between ORA’s and AVR’s revenue requirement increase estimates are due to ORA’s adjustments as summarized in the Executive Summary of this report.

### Table 1-A

<table>
<thead>
<tr>
<th>Test Year 2015 Revenue Requirement Increase (Domestic)</th>
<th>Amount of Increase</th>
<th>Percent Increase</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVR</td>
<td>$3,105,013</td>
<td>14.91%</td>

<td>7.98%</td>
</tr>
<tr>
<td>Difference</td>
<td>$1,459,113</td>
<td>6.93%</td>
</tr>
</tbody>
</table>

Table 1-B presents a comparison of ORA’s and AVR’s estimates for ROR for the Test Year 2015 at present rates and at AVR’s proposed rates. As shown, at AVR’s proposed rates, ORA estimates that the company will earn an ROR of 10.80%, which is 1.73% higher than its authorized 9.07% ROR for Test Year 2015.

</table>

C. CONCLUSION

ORA recommends that the Commission find ORA’s Test Year 2015 results of operations, presented in Tables 1-3 and 1-5 in Appendix A reasonable and
authorize a revenue *increase* of $1,645,900 or 7.98% for the domestic system and
a revenue *increase* of $14,200 or 7.36% for the irrigation system.
CHAPTER 2: WATER CONSUMPTION AND OPERATING REVENUES

A. INTRODUCTION

This chapter presents ORA’s analysis and recommendation on forecasted number of customers, consumption per customer, unaccounted for water, and operating revenues. ORA reviewed AVR’s Revenue Requirements Report, supporting workpapers, data request responses, and method of estimating water consumption and operating revenues to arrive at the recommendations in this chapter.

A forecast of number of customers, consumption, and revenues at present rates is important not for determining future revenue requirements – as revenue requirements in ORA’s Report are based upon the total of estimated expenses and a return on estimated investment – but rather for calculating the percentage increase or decrease in customer rates that is necessary to arrive at estimated revenue requirements.

To illustrate, an unchanged or even lower estimated revenue requirement might still result in a rate increase if the number of customers or the consumption per customer has decreased to a level less than previously adopted. In other words, if there are fewer customers or lower consumption, an increase in rates would still be needed to recover that same amount of costs (i.e., revenue requirement). Conversely, if estimates of total revenue fail to include all sources of revenue under existing customer tariffs, the result will be an unnecessarily high rate increase percentage to meet the estimated revenue requirement.

B. SUMMARY OF RECOMMENDATIONS

Tables 2-1 through 2-7 in Appendix A show AVR’s and ORA’s estimates for average number of customers, water consumption, and operating revenues. The differences in the estimates of customers and consumption are due to differences in calculations and methodologies as discussed below.
C. DISCUSSION

In accordance with the Rate Case Plan (D.07-05-062), utilities are required to forecast customer growth using a five-year average of the change in the number of customers by customer class. Should an unusual event occur, or be expected to occur, then an adjustment to the five-year average can be made. Further, the applicant utility and ORA must calculate consumption by using a multiple regression to forecast per-customer usage for the residential and commercial customer classes in general rate cases based on the New Committee Method. This method relies on Standard Practice No. U-25 and “Supplement to Standard Practice No. U-25” with the following improvements:

- Use monthly data for 10 years, if available;
- Use 30-year average for forecast values for temperature and rain; and
- Remove periods from the historical data in which sales restrictions were imposed or the Commission provided the utility with sales adjustment compensation, but replace with additional historical data to obtain 10 years of monthly data, if available.²

Number of customers and unit consumption are the basis for all revenue forecasts, so the subsequent comparison of revenue will reflect the changes made in these projections. The water supply estimates then take into account any changes in estimated number of customers, unit consumption, and unaccounted for water. For water supply, a distinction is made between the “domestic” customer classes and the “gravity irrigation” customer. This unique irrigation customer, a golf course on Jess Ranch, has a special agreement and situation involving a fishing nursery and connected ponds. Several factors result in high reported unaccounted for water in the irrigation system: 1) the demands of the aquaculture; 2) evaporation; 3) seepage through the beds of the lakes; and 4) water that simply

flows out the other end of the non-pressurized system as return flows to the basin.

In order to allow AVR to reasonably assess the unaccounted for water in the domestic system, the gravity irrigation system is shown with a unique unaccounted for water percentage. This practice is consistent with past GRCs.

1) **Customers**

ORA reviewed AVR’s estimates for the number of customers for all ten classes. ORA recommends including 2013 recorded data for this analysis in order to use the most recent and best available data.

**a) Residential**

The residential class five-year average growth over the period of 2008-2012 was 42 customers per year. AVR projects annual residential customer growth to be 142 customers per year beginning in 2013, which includes the 42 customers mentioned above and 100 additional customers per year for a planned development in Jess Ranch.

ORA estimates customer growth using the five-year average growth from 2009-2013, calculated as 95 customers per year. Based on the planned development construction witnessed during an on-site visit in February 2014, ORA does not believe it is reasonable to expect 100 new homes to be completed and occupied with new customers on the system until next year. ORA, therefore, recommends using 95 customers per year to calculate customer growth for 2014, and 195 customers per year beginning in Test Year 2015.

**b) Business/Commercial**

AVR calculated the commercial class five-year average growth of 9 customers per year from 2008 to 2012. ORA estimates this class of customers using the 2009-2013 5-year average growth of 13 customers per year starting with the 2013 recorded number of 1,358 customers. This would project 1,384 in the Test Year 2015, and 1,397 in the Escalation Year 2016.
c) Industrial, Public Authority – Irrigation, Gravity Irrigation, Apple Valley Golf Course, and Public Authority

ORA agrees with AVR’s customer projections of zero growth for Industrial, Public Authority – Irrigation, Gravity Irrigation, and Apple Valley Golf Course. All of these customer classes have had a consistent number of customers for the last five years or longer. The current counts for these classes are two Industrial customers, five Public Authority – Irrigation customers, one Gravity Irrigation customer, and one Apple Valley Golf Course customer. Public Authority gained two customers in 2011, but otherwise has had no growth over a five-year period.

d) Private Fire

Based on the 2008-2012 five-year average, AVR estimated 17 new private fire customers per year. Reflecting the declining growth in this customer class, ORA recommends using the five-year average growth (2009 through 2013) of 8 customers per year. This would project 240 private fire customers in the Test Year 2015, and 248 in the Escalation Year 2016.

e) Pressure Irrigation

The Pressure Irrigation customer class provides service to common areas within the Jess Ranch Community. AVR proposes five new customers per year. ORA recommends using the five-year average change (2008-2009 through 2012-2013) of four customers per year. This would project 166 in the Test Year 2015, and 169 in the Escalation Year 2016.

f) Temporary Construction

The temporary construction customer class differs from other classes in that there is no meaning in a growth per year value, rather a rolling average number of customers over a year is estimated. AVR assumes all temporary construction will be related to new commercial customers and suggests they will be equal to the
number of new commercial projects each year. The five-year average (2008–
2012) number of customers (not growth) has been 6 commercial customers. ORA
recommends using 5-year average growth (2009-2013) of 9 customers in both Test
Year 2015 and Escalation Year 2016.

2) **Water Sales Per Customer**

Customer unit consumption has been somewhat unstable in the last 5 years. This may be due to several factors such as an unstable economy, local
couragement of conservation, rate increases, implementation of a conservation
rate design that provides an incentive to save water, the recent drought, and/or
recent statewide legislation encouraging water conservation. ORA agrees the
current state of the economy and the declared drought provides a justified unusual
event and allows for a deviation from a multiple regression, the preferred forecast
tool for customer consumption projections within the Rate Case Plan.

a) **Residential and Business/Commercial**

Both AVR and ORA performed a regression analysis (AVR using the
software Stata and ORA using the software program Eviews) to follow the Rate
Case Plan for residential and business unit consumption forecasts. AVR included
temperature, precipitation, time, a dummy variable for each month, and a dummy
variable for conservation. The residential class yielded good results with R-
Squared values of 0.94 for the model that includes rainfall, monthly dummies,
time, and the conservation dummy. Nevertheless, AVR rejects the econometric
method for the residential class because the forecast overstates the effects of the
drastic drop in unit consumption that occurred between 2007-2011, with a peak of
290.11 ccf per customer in 2007 down to the level of 200.85 ccf per customer in
2011. AVR forecasts a 1.5% annual reduction for its residential class starting with
2012 actual recorded consumption.

ORA reviewed the New Committee Method model results and performed a
regression analysis. For residential customers, the R-squared was statistically
significant, but the output was not consistent with the recent trend in consumption that has occurred in years 2012 and 2013. ORA agrees that given the substantial decreases in consumption already experienced, it is not reasonable to expect a continued downward trajectory at this level. Based upon the circumstances presented in this case, ORA will accept AVR’s proposed 1.5% annual decrease for the residential and commercial/business customer classes consumption starting from 2013 recorded consumption of 201.34 ccf for residential and 591.68 for commercial. It is unknown how long consumer behavior will hold with the conservation message. As the economy recovers, consumption behavior is likely to increase. To accurately forecast consumption during transition periods between droughts and major changes in the economic landscape, more refined tools or complex modifications to the New Committee Method may be needed. ORA recommends that any changes to the New Committee Method ought to be done in an industry wide proceeding such as a Rulemaking, and not on a case-by-case basis.

b) Industrial, Public Authority, Private Fire, Public Authority Irrigation, Pressure Irrigation, Apple Valley Golf Course, and Temporary Construction

According to the Rate Case Plan, water sales for classes of service other than residential and commercial should be forecasted based on total consumption by class using the best available data. AVR did not have a uniform method for forecasting the consumption for the industrial, public authority, private fire, public authority irrigation, pressure irrigation, gravity irrigation, and temporary construction customer classes. For each class, ORA compared AVR’s proposed consumption forecast to the five-year average unit consumption and, in each case, ORA found the five-year average unit consumption to provide the best estimate. ORA asserts that, similar to the residential and commercial customer classes, it is more accurate to forecast based on unit consumption than total consumption by
class. ORA applies the five-year unit consumption average for consistency and to capture wider fluctuations in recorded data.

3) Unaccounted for Water

Unaccounted for water includes real and apparent losses. Real losses are those caused by leaks in mains, service connections, valves, hydrants, or storage tank overflows and leaks. Apparent losses include meter measurement inaccuracies, data handling errors, and unauthorized consumption. Unaccounted for water is determined as the difference between the total amount of water produced and the total amount of water recorded for sales.

Because of the unique conditions for the Gravity Irrigation customer regarding supply and unaccounted for water, determinations are considered separately from the rest of the system. The remaining customer classes are collectively referred to as the “domestic” system.

AVR’s forecast of unaccounted for water for the domestic system is 7.0%. This is a decrease over the 8.0% authorized in the last GRC, but still reflects a higher average in unaccounted for water than experienced between 2010 and 2013. In response to ORA’s inquiry, AVR provided updated unaccounted for water data including 2013 balances. The 2-year average using 2012 and 2013 data is 5.1%. AVR works actively to reduce the unaccounted for water through meter testing, main replacements, and efforts to find unauthorized water use. ORA recommends the Commission adopt the 2-year recorded average unaccounted for water target of 5.1%.

AVR’s forecast of unaccounted for water for the Gravity Irrigation system is 79.6%. AVR referred to its forecast as “based on the last two recorded years.”

---

3 Domestic unaccounted for water percentages: 2010 – 7.5%; 2011 – 7.9%; 2012 – 5.0%; 2013 – 5.2%.

5 Id.
In response to ORA’s inquiry, AVR provided an updated worksheet calculating a 2-year balance in unaccounted for water of 76.5%. This high water loss for the Gravity Irrigation system is attributed to evaporation and seepage in a series of lakes. AVR is required to maintain specific water levels at these lakes for fishery, and as a source to irrigate greenbelts and the golf course at Jess Ranch. A water supply agreement between AVR and Jess Ranch Water Company requires AVR to maintain the water level for various lakes in exchange for sufficient water rights at no cost to AVR. ORA recommends using the corrected 2-year recorded average of 76.5% as the unaccounted for water forecast for Gravity Irrigation.

4) Operating Revenue

Operating revenue is calculated by multiplying the number of customers by their applicable water use and applying the current tariff rates (effective January 1, 2014) for the present revenue and AVR’s proposed rates for the proposed revenue.

For Test Year 2015, the total operating revenues calculated by ORA are $20,830,022 at present rates and $23,994,437 at AVR’s proposed rates. AVR’s calculations are $21,023,536 at current rates and $24,168,407 at AVR’s proposed rates.

D. CONCLUSION

To obtain a reasonable estimate of any necessary rate change in order to meet an estimated test year revenue requirement, the Commission should adopt ORA’s recommendations to: (1) use a five-year average of customer growth for forecasting active service connections; (2) use AVR’s estimates of forecasted consumption for the residential and commercial classes beginning with 2013 consumption; and (3) accurately reflect all sources of revenues, including the forecasted revenues associated with new special fees in revenue forecasts.
CHAPTER 3: OPERATIONS AND MAINTENANCE,
ADMINISTRATIVE AND GENERAL EXPENSES

A. INTRODUCTION

This chapter presents ORA’s analysis and recommendations on Operation and Maintenance (“O&M”), and Administrative and General (“A&G”) for Apple Valley Ranchos Water Company (“AVR”) for Test Year 2015. Table 3-A shows a comparison of total Domestic O&M and A&G expense estimates at present rates for test year 2015.

B. SUMMARY OF RECOMMENDATIONS

The differences in the above tables are mainly a result of the changes in water production recommended by ORA’s revenue witness in Chapter 2, as well as the difference in the escalation rate used by ORA, and those used by AVR. Other adjustments made by ORA are described below.

C. DISCUSSION

OPERATION AND MAINTENANCE EXPENSES

ORA conducted an independent analysis of AVR’s work papers and methods of estimating the O&M Expenses for Test Year 2015. AVR uses a five-year (2009 to estimated 2013) average of historical expenses adjusted for inflation as the basis for projecting Test Year 2015 with the exception of Purchased Power, Leased Water Rights, and Replenishments.
ORA uses five-year averages of historical expenses (2009 to recorded 2013) adjusted for inflation to assess the reasonableness of AVR’s estimates, except where otherwise noted. AVR stated that it used the most recent ORA inflation factors when it filed their application. The inflation factors used by ORA, for normalization and escalation, are developed from ORA’s Energy Cost of Service Branch (“ECOS”) memorandum dated March, 25th of 2014. ORA found that AVR did not use the same inflation factors in its estimates and AVR used July 2013 escalation factors.

1) Operations Payroll
For an estimate of Payroll – Customers expenses, please refer to Chapter 4 of this report.

2) Operations – Other
AVR used a five year escalated average of recorded dollar expenses for all line items except Grounds-keeping Pump Misc, which is based on estimated 2013 costs escalated to the 2015 Test Year, and Other Water Treatment OP, which is amortized over 3 years. ORA used the same five year escalated average of recorded dollars expenses methodology for all line items. AVR is requesting $157,003 for 2015. ORA is recommending $159,000 for 2015. The difference is
due to ORA using different escalation factors and recorded 2013 expense which is slightly higher than AVR’s estimated 2013 expense.

3) Purchased Power

The cost of electricity needed to operate the pumping and delivery of water is called purchased power expense. Both AVR and ORA use the same Southern California Edison and Southwest Gas rates for their calculations. The estimate of purchased power varies with the quantities of water delivered. AVR developed the total amount of power required for Test Year 2015 from the ratio of power consumption and water production (KWH / Therms per CCF) by individual wells and boosters from the 2010-2012 three year average. This ratio was multiplied by the estimated Test Year water production and purchased power rates to calculate the Domestic Test Year power consumption cost of $1,010,269.

ORA finds AVR’s methodology to be reasonable but estimates lower sales and water production compared to AVR for the Domestic Test Year, as discussed in Chapter 2 of this Report. ORA estimates $1,010,300 for Domestic for Test Year 2015. Using the above methodology, ORA estimates the Irrigation for Test Year amount to be $87,230.

4) Leased Water Rights

AVR estimated that for Test Year 2015 it will need 2,520 acre feet of leased water rights at a rate of $382.50 per acre foot, based on the total cost of transfer of leased water rights divided by the adjusted amount of transfer acre feet from the sources that AVR leases water rights from, resulting in a total cost of $963,849. AVR’s leased water proposal is based on current and future demand while they continue to make efforts to purchase water rights. ORA finds AVR’s methodology to be reasonable but estimates a lower sales and water production relative to AVR for the Test Year as discussed in Chapter 2 of ORA’s Report. With the decreases in sales and water production, ORA estimates the need for 2,182 acre feet of leased water rights at a rate of $382.50 per acre foot, and a total
cost of $834,735 for Test Year 2015. ORA asserts that its estimates and recommendations are reasonable and should be adopted by the Commission.

5) Replenishment

AVR estimated total replenishment charges for Domestic and Irrigation consist of two assessments – the Make-up Assessment and the Administrative / Biological Assessment. The assessments are obligations required by the Mojave River Basin Water Master and levied on pumpers to offset the costs of administering a stipulated judgment and purchasing replacement and make-up water in the basin. AVR’s and ORA’s estimates for the replenishment charges are shown in the table below:

</tbody>
</table>

ORA finds AVR’s methodology to be reasonable. The differences are due to different sales.

6) Chemicals

For Chemicals expense AVR based its Domestic for Test Year 2015 estimate on a five – year average of recorded constant dollar data, and then escalated by its inflation factor to arrive at its estimate of $22,180. ORA used the same methodology to arrive at its estimate of $21,900. The difference is due to ORA using different escalation factors and recorded 2013 data.
7) Payroll - Customers
For an estimate of Payroll – Customers expenses please refer to Chapter 4 of this report.

8) Customers - Others
AVR is requesting $226,100 for Test Year 2015. ORA recommends that AVR only be allowed $206,000 Test Year 2015. ORA bases its recommendation on a 5-year average of the company’s historical expenditures in the account from 2009 to 2013. The difference is due to ORA using different escalation factors and recorded 2013 data.

9) Payroll Maintenance
For an estimate of Payroll Maintenance expenses, please refer to Chapter 4 of this Report.

10) Maintenance - Other
AVR requested $621,100 for Test Year 2015. ORA recommends $665,000 for 2015. ORA used a 5-year average of AVR’s historical expenditures that were escalated to compensate for inflation. The difference is due to ORA using different escalation factors and recorded 2013 data. The recorded 2013 expense is higher than AVR’s estimated 2013 expense by approximately $18,000.

11) Payroll – Clearings
For an estimate of Payroll Maintenance expenses, please refer to Chapter 4 of this Report.

12) Depreciation– Clearings
Depreciation – Clearings expenses are derived from the plant chapter and shown in ORA’s R.O. Table 9-1 in Appendix A of this report.

13) Clearings – Other
AVR used a five year escalated average of recorded dollar expenses for all line items except for certain items based on payroll, and monthly billings to estimate the Domestic for Test Year 2015 expense of $218,000. The same five
year escalated average methodology was used to compute the Irrigation for Test Year 2015 amount of $3,142.

ORA used the same methodology except that the categories based on payroll reflect the recommendations from the payroll witness. ORA’s analysis arrived at $207,612 for Test Year 2015. The same five year estimating technique was used to derive the Irrigation portion of the account for which ORA is recommending $3,122. ORA recommends that the Commission adopt ORA’s estimates.

14) Uncollectibles
AVR estimates an uncollectibles factor of 0.48% as a percentage of Present Revenue based on a 5-year average, for Domestic for Test Year 2015. ORA found AVR’s uncollectibles factor of 0.48% reasonable.

15) Conservation
This section presents ORA’s analysis and recommendations of AVR’s conservation expenses for Test Year 2015 and Escalation Years 2016 and 2017. AVR requests conservation budgets of $113,528, $116,933, and $120,441 for 2015, 2016 and 2017, respectively. ORA disagrees with AVR’s estimates for conservation budgets and recommends $67,817, $69,445 and $71,042 in 2015, 2016, and 2017, respectively.

a) Conservation Estimates
As part of the previous GRC, AVR submitted a Water Use Efficiency Business Plan (WUEP) outlining its strategy to implement water conservation programs and reach BMP and regulatory compliance. The WUEP described five components of conservation spending: (1) Public Information & Outreach, (2)

---

6 AVR is a member of the California Urban Water Conservation Council (CUWCC) and signatory to a CUWCC Memorandum of Understanding, committing themselves to implementation of Best Management Practices (BMPs) for more efficient use or conservation of water.
Home Owners Association and Large Landscape High Efficiency Nozzle Distribution, (3) Multi-Family High Efficiency Toilet Direct Install, (4) Single Family Landscape Survey and Nozzle Distribution, and (5) Cash for Grass Turf Removal (depending on participation and funding from the Mojave Water Agency). Based on the recommendations contained in the WUEP, D.12-09-004 authorized a total cap for conservation programs of $321,126 over a three-year period to be captured in a One-Way Balancing Account. The estimated annual conservation budgets described in the WUEP are $103,894 in Test Year 2012, $107,011 in Escalation Year 2013, and $110,221 in Escalation Year 2014. The settlement allowed for some flexibility in spending stating “because conservation costs may not be incurred evenly throughout the rate case cycle, [the authorized budget] will cover the entire rate cycle versus a yearly cap.”

As of this report, AVR spent $59,157 in 2012 and $70,296 in 2013 on conservation programs. For 2014, AVR has adopted the $110,221 annual conservation budget described in the WUEP.

For conservation estimates used in AVR’s workpapers under O&M expenses, AVR used $110,221 (2014 annual conservation budget described in the WUEP) escalated by its composite escalation factor of three percent to arrive at Test Year estimate $113,528. For Escalation Year 2016, AVR escalated the Test Year estimate by its composite escalation factor of three percent to derive $116,933. AVR then escalated its 2016 estimate by three percent to derive $120,441 for the 2017 estimate, for a total of $350,902 for this three-year GRC cycle.

As AVR did not provide a breakdown to support its adopted conservation budget, ORA based its conservation cost estimates on 2012 and 2013 recorded expenses. To bring 2012 recorded expenses to 2013 dollars, ORA multiplied $59,157 by ORA’s 2013 ECOS composite escalation factor of 0.9% to arrive at

---

ORA then calculated a two-year average of the conservation expense totals of $59,689 for 2012 (in 2013 dollars) and $70,296 for 2013 to derive the two-year average of $64,293. ORA multiplied the two-year average by ORA’s escalation factor for each year to calculate the proposed budgets. ORA estimated $67,817 for Test Year 2015, $69,445 for Escalation Year 2016, and $71,042 for escalation year 2017, which totals $208,304 for this GRC three-year cycle.

In its application, AVR did not explain how it plans to spend its proposed 2014 budget of $110,221. In preparing its response to ORA’s inquiry regarding planned expenditures, AVR realized that its proposed budget would result in under-spending the authorized cap by $81,452. AVR stated that in addition to spending the adopted 2014 budget of $110,221, AVR plans to spend the $81,452 underspend of the conservation budget for 2012 & 2013 on conservation programs. In total, AVR now plans to spend $191,673 in 2014, a 173% increase over 2013 spending. This response highlights that AVR did not have a detailed comprehensive plan for conservation spending in the current year. ORA finds that AVR does not warrant having a larger conservation budget for this GRC. Simply playing catch up is an inefficient way to spend a conservation budget, which does not follow a comprehensive plan, and may lead to mis-spent dollars resulting in a higher costs burden to ratepayers to fund these programs. Further, not spending the conservation budget as planned can also impact the expected goals to achieve reductions in water demand.

---

9 ORA used the following composite escalation factors: 2014 – 2.0%; 2015 – 2.3%; 2016 – 2.4%; 2017 – 2.3%.

11 Data Request JRE 004 March 26, 2014 and response dated April 2, 2014.
ORA found that most of AVR’s conservation expenses were for customer information and outreach (such as participation in school programs, workshops, and festival giveaways) and distribution or installation of water saving devices (i.e., high efficient hose nozzles and shower heads and high efficiency toilets). AVR has not provided cost-benefit analysis as part of this proceeding. AVR has provided insufficient cause to initiate new programs and expenses that are burdensome to its ratepayers. Without any preliminary cost-benefit analysis by project type, the approval of the increased budget is unreasonable.

Additionally, AVR residential consumption has decreased significantly since 2007, and the general long-term consumption trend is expected to continue to decline. The WUEP’s estimates show that AVR has surpassed the 20% reduction by 2020 set forth in SBx7-7 – the Water Conservation Act of 2009. Hence, ORA recommends lowering AVR’s conservation spending. Considering the significant reductions already achieved, ORA does not believe that AVR should be requesting an increase in conservation spending during the next three years.

**b) Conservation Balancing Account**

ORA recommends the Commission should again require AVR to track conservation expenses in a capped, one-way balancing account, as was ordered in the last GRC. This one-way balancing account should continue to be subject to refund so that any unspent funds will be returned to the ratepayers in AVR’s next GRC filing. For the cycle authorized in the last GRC, AVR should submit an advice letter 30 days after it closes the balance in the account for 2014 to provide refunds to ratepayers for any unspent funds.

AVR should continue to implement the five components of the WUEP described above. As authorized in the last GRC, ORA recommends a cap of

---

12 Response to Data Request JRE 002 dated March 18, 2014.
$30,000 per year (2015-2017) for spending on Public Information and Outreach programs. Otherwise, AVR should be allowed flexibility in the annual budgets for the specific programs outlined in the WUEP, provided that all conservation spending is for programs that meet BMPs, consistent with the intent of AVR’s MOU with the CUWCC to continuously maintain an economically efficient conservation plan designed to meet conservation goals. ORA recommends the Commission adopt ORA’s conservation expense estimates of $67,817 for Test Year 2015, $69,445 for Escalation Year 2016, and $71,042 for Escalation Year 2017.

**ADMINISTRATIVE AND GENERAL EXPENSES**

ORA analyzed AVR’s reports, supporting work papers, responses to data requests such as HMC-001, HMC-002, HMC-003, HMC-004, and other information provided in meetings and e-mails, and AVR’s methods of estimating A&G expenses, before making its own independent estimates. ORA applied the various escalation factors established by the ORA Energy Cost of Service Branch (“ECOS”) found in the March 25, 2014 publication to develop the level of expenses requested in this application. AVR based its application escalation factors from the ORA Energy Cost of Service Branch (“ECOS”) July 31, 2013 memorandum.

16) **A&G Payroll**

For an estimate of A&G Payroll expenses, please refer to Chapter 4 of this Report.\(^{13}\)

17) **Employee Benefits**

For an estimate of Employee Benefits expenses, please refer to Chapter 5 of this Report.\(^{14}\)

\(^{13}\) See ORA testimony of James Simmons (Chapter 4) on Payroll.

\(^{14}\) See ORA testimony of Jose Cabrera (Chapter 5) on Pensions and Benefits Expenses.
18) Insurance

AVR’s Insurance expense consists of Workmen’s Compensation and other business liability policies, such as auto insurance, that are based on annual premiums and estimated premium increases anticipated by the utility’s insurance broker. Workmen’s Compensation premiums are also tied to estimated overall payroll. AVR based its Test Year Domestic estimate by starting with the current annualized premiums and factoring in any change in insurance rates forecasted by AVR’s insurance broker and, where appropriate, adding a factor for changes in payroll consistent with the test year estimates made by the Company to estimate $662,982. The same methodology was used to compute the Test Year Irrigation amount of $1,291. The forecasted increases of 3.0% in insurance rates, which are higher than the ECOS factors used by ORA, are based on the recommendations of AVR’s insurance broker.

Although ORA finds AVR’s method to be reasonable, ORA adjusted the amounts as a result of the payroll recommended in Chapter 4 of this Report. As a result, ORA estimates $644,088 for Domestic for Test Year 2015. Using the same methodology, ORA estimates the Irrigation for Test Year 2015 amount to be $1,281. As a result of the payroll recommended, ORA asserts that its estimates are reasonable and should be adopted by the Commission.

19) Uninsured Property Damage Expense

For Uninsured Property Damage expense, AVR based its Test Year Domestic estimate on a five-year average of recorded expenses (2009 – 2013, with 2013 partially estimated) escalated by its inflation factors to estimate $8,785. ORA used the same methodology, except that the recorded 2013 amount was used instead of an estimate to escalate to the Test Year amount of $8,717.

---

\(^{15}\text{See ORA testimony of James Simmons (Chapter 4) on Payroll.}\)
20) Regulatory Commission Expense

AVR’s Regulatory expense estimate is $162,304 for Test Year 2015. AVR’s estimate of Regulatory Commission Expense reflects the additional expense of a separate Cost of Capital proceeding. AVR’s estimate of Regulatory Commission Expense is based on the actual amount incurred the prior Test Year 2012 rate case escalated to the test period plus the outside consulting costs associated with the following: (1) WRAM and Sales Adjustment Mechanism, (2) Asset Management Report for main replacements, and (3) Total Compensation Study. Added to this amount is the one-third expense associated with the previous cost of capital proceeding ((A.13-05-027) filed May 1, 2012 for Test Year 2013) escalated to the test period. In addition, AVR projects $16,500 of customer notices associated with the low-income data sharing program. The total is then amortized over three years.

ORA’s estimate of Regulatory Commission Expense is based on the actual amount incurred the prior Test Year 2012 rate case escalated to the test period. Added to this quantity is the forecasted amount for the Cost of Capital filing in 2016, based on the one-third expense associated with the 2013 Cost of Capital proceeding already incurred, escalated to the test year. In addition, ORA projects $5,217 of customer notices associated with the low-income data sharing program based on previous levels escalated to the test year. The total is then amortized over three years. The outside consulting costs associated with the following: (1) WRAM and Sales Adjustment Mechanism, (2) Asset Management Report for main replacements, and (3) Total Compensation Study were not included since these costs have already been incurred. The Regulatory Commission Expense should forecast prospective costs and not engage in retroactive ratemaking. Thus, ORA’s calculated Regulatory Commission expense for AVR is $131,341 for Test Year 2015.
21) Franchise Requirements

AVR’s Franchise Requirements estimate is $202,020 for Test Year 2015.

Franchise Fees are estimated at 0.97% of gross revenues based on the 5-year average of recorded percentages from 2008 – 2012. ORA finds that AVR’s estimate of 0.97% is reasonable and estimates a Franchise Requirement of $200,185 for Test Year 2015 based on the recommended operating revenue by the revenue witness.16

22) Outside Services

AVR based its Outside Services expense on a five-year (2009 – 2013, with 2013 partially estimated) average of recorded expenses (excluding Audit and Income Taxes, Insurance Consulting, Safety Consulting and Other General Consulting) escalated to result in the Domestic for Test Year 2015 amount of $261,181.

For Audit and Income Taxes and Insurance Consulting, AVR used hardcoded budgeted amounts.

Regarding Safety Consulting, in addition to the five-year average, AVR proposes to conduct an Arc Flash Hazard Assessment, a Vulnerability/Mitigation Study for Natural Disasters, and a Water Supply Evaluation.

In terms of Other General Consulting, in addition to the five-year average, AVR plans to (1) utilize public relations consultants for message development and outreach tools to enhance its public relations program with the customers and the cities that it serves and (2) propose to conduct 360 degree Leadership Feedback Reviews for supervisors and managers to improve their performance and in turn improve the performance throughout the organization.

The five-year escalated average methodology was used to compute the Irrigation for Test Year 2015 amount of $4,146.

16 See ORA testimony of Julie Ende (Chapter 2) on Water Consumption and Operating Revenues.
ORA utilized the same methodology as AVR except that the recorded 2013 amount was used instead of an estimate and a five-year (2009-2013) average of recorded expenses used for Audit and Income Taxes and a two-year (2012-2013) average of recorded expenses was used for Insurance Consulting because they are more indicative of the actual trends.

a) **Arc Flash Hazard Assessment, the Vulnerability/Mitigation Study for Natural Disasters, and the Water Supply Evaluation portions from Safety Consulting**

ORA removed the Arc Flash Hazard Assessment, the Vulnerability/Mitigation Study, and the Water Supply Evaluation portions from Safety Consulting because they are not mandated by any agency and there have been no hazardous, natural disaster and power outage incidents in to date.\(^\text{171819}\)

Furthermore, there are no current or expired terrorism alerts from the U.S. Department of Homeland Security’s National Terrorism Advisory System, since its inception on April 20, 2011 and no level change in over eight years, since August 12, 2005.\(^\text{20}\) Also, using the data from the Southern California Earthquake Center’s Uniform California Earthquake Rupture Forecast (which the federal U.S. Geological Survey refers to), the probability of an earthquake of magnitude 6.7 or larger occurring in the Los Angeles area is just 6.7% over the next three years.\(^\text{21}\)

On Friday March 28, 2014 there was a 5.1 magnitude earthquake in the La Habra area of Southern California but there is little chance that it’s a sign that a more powerful earthquake. According to seismologist Kate Hutton from the California

\(^{21}\) See the Southern California Earthquake Center’s website regarding the Uniform California Earthquake Rupture Forecast (http://www.scec.org/ucerf2/).
Institute of Technology Seismological Laboratory, there's a "one in 20" chance that the recent earthquakes would be precursors to a much larger earthquake.\(^{22}\)

b) Public Relations Consulting and 360 degree Leadership Feedback

ORA removed these expenses and ORA believes that AVR’s public relations program should continue to be done internally and that the 360 degree Leadership Feedback is not needed since it is not mandated by the Commission or any other agency and AVR has not identified specific areas where it has found managerial weaknesses or that are not well managed by the company.\(^{23}\)\(^{24}\)

As a result, ORA estimates $230,307 for Domestic for Test Year 2015.

ORA utilized the same methodology as AVR for Irrigation except that the recorded 2013 amount was used instead of an estimate. As a result, ORA estimates $4,621 for Irrigation for Test Year 2015.

23) A&G - Other

AVR used a five-year average of recorded expenses (2009 – 2013, with 2013 partially estimated) for all line items, with the exception of nine categories of expenses, to estimate the Domestic for Test Year 2015 expense of $514,452.

---

\(^{22}\) See Calif. earthquakes unlikely to be signs of the Big One, USA TODAY; Associated Press (http://www.usatoday.com/story/news/2014/03/31/california-earthquakes/7117899/)

\(^{23}\) See AVR’s Data Request response to HMC-004 question 4.

\(^{24}\) See AVR’s Data Request response to HMC-004 question 5.
AVR did not use the five-year escalated average of recorded expenses (2009 – 2013, with 2013 partially estimated) for the following line items: (1) Temporary Labor; (2) Leased Lines; (3) Travel, Lodging and Miscellaneous; (4) Meals and Entertainment; (5) Registration; (6) Other Administrative General; (7) Company Membership; (8) Emergency Preparedness Supplies; and (9) the Corporate A&G Allocation.

AVR used a five-year average of recorded expenses (2009 – 2013, with 2013 partially estimated) escalated average of recorded expenses for all line items, with the exception of Company Membership expenses, to estimate the Irrigation for Test Year 2015 expense of $249.

ORA used the same five-year escalated average of recorded expenses methodology for all line items where AVR used a five-year escalated average (other than Nextel), except that the recorded 2013 amount was used instead of an estimate. ORA agreed with AVR’s estimates for Temporary Labor and Leased Lines. From the Nextel account, ORA removed the Nextel amount from the test year since AVR stated that they completed the process of changing carriers from Nextel to Verizon in 2012.

Concerning Company Membership, ORA revised the calculation used by AVR (allocated NAWC and CWA dues and recorded 2012 dues of the other organizations escalated to the test year) by using the revenue amount recommended by the revenue witness and used the revised escalation factors. Also, ORA removed from ORA’s calculations payments to Community Based Organizations such as the Apple Valley Chamber of Commerce, the High Desert Employer Advisory Council, the Climate Registry, and also Costco Wholesale
Membership. The Commission does not allow rate recovery of dues to chambers of commerce, and AVR has not shown that its membership payments to the other referenced organizations benefit ratepayers.\textsuperscript{26}

Regarding the Emergency Preparedness Supplies, AVR stated, “To date there have not been emergency incidents where AVR was called upon to utilize its emergency preparedness supplies.”\textsuperscript{27} Therefore, taking into consideration the terrorism and earthquake information discussed in the Outside Services section of A&G and the fact that there have been no hazardous, natural disaster and power outage incidents in the past, ORA removed the Emergency Preparedness Supplies.

The Corporate A&G Allocation discussion is found in Chapter 12 of this report. ORA proposed $41,302 for the Corporate A&G Allocation.\textsuperscript{28}

ORA applied these adjustments to arrive at the Domestic for Test Year 2015 amount of $451,471 and Irrigation for Test Year 2015 amount of $238 for A&G-Other.

(1965) 62 Cal.2d 634, 669) (stating the Commission’s “long-standing policy not to allow recovery in rates of dues to chambers of commerce and service clubs,” and, further, explaining that in order to receive Commission approval for rate recovery of any membership dues a utility must “meet its burden of proof in demonstrating how these organizations relate to the utility’s business and offer ratepayer benefits.”).

\textsuperscript{28} See AVR’s Data Request response to HMC-004, Q. 6.
Entertainment number
Registration $19,272 5 year avg $22,297 Escalated budgeted amount
Other Admin General $36,755 5 year avg $69,831 Escalated budgeted amount
Company Membership $57,206 Removed dues $61,477 Allocated and escalated amount
Emergency Preparedness $0 Removed kits $1,504 Escalated budgeted amount
A&G Allocation $41,302 GO Payroll $41,970 GO Payroll

24) A&G Transferred
AVR A&G Transferred estimate for Domestic is ($637,345) for Test Year 2015. ORA’s Transferred estimate for Domestic, due to changes in capital budget as recommended in Chapter 8, Utility Plant in Service, of this Report, is ($184,846) for Test Year 2015.

25) Rents
For Rent expense AVR based its Domestic for Test Year 2015 estimate on a five-year average of recorded expenses (2009 – 2013, with 2013 partially estimated) escalated by their inflation factor to estimate $17,281. ORA used the same methodology except that the recorded 2013 amount was used instead of an estimate to arrive to the Test Year 2015 amount of $16,711. ORA asserts that its estimate is reasonable and should be adopted by the Commission.

26) General Office Allocation
For an estimate of General Office Allocation expenses, please refer to Chapter 12 of this Report.
ORA recommends that the Commission adopt its A&G expense estimates and recommendations as described above.

---

29 See ORA testimony of Jenny Au (Chapter 8) on Utility Plant in Service.
D. CONCLUSION

ORA recommends that the Commission adopt its O&M and A&G expense estimates and recommendations as described above.
CHAPTER 4: PAYROLL

A. INTRODUCTION

This section discusses ORA's analysis of AVR’s operating service area and General Office payroll expenses for Test Year 2015 in this general rate case ("GRC").

B. SUMMARY OF RECOMMENDATIONS

ORA recommends the Commission approve ORA’s Operating Payroll of $3,781,573. AVR has not increased its proposed headcount from that which the Commission approved in the last GRC. Rather, AVR has combined existing positions and eliminated others. ORA recommends approval of AVR’s proposed payroll addition of one part-time position for a Civil Engineer Intern. ORA’s estimate is based on AVR’s actual payroll increases granted for 2014 of 2.75%, plus scheduled promotions for 2014 and 2015, and ORA’s estimated Test Year 2015 CPI-U increase of 1.3%.

In D.12-09-004, the Commission ordered AVR to conduct a total compensation study: 31 “Apple Valley Ranchos Water Company must present a detailed study and testimony in its next general rate case to justify its total compensation package for all levels of workers in terms of both the local Apple Valley labor market as well as the water industry in California”

PWC commissioned Human Performance Consultation (HPC) to perform a compensation study. Although AVR presents HPC’s survey results in its workpapers accompanying its GRC Application, it did not submit any analysis comparing the results of the survey to its own total compensation levels. The results of PWC’s Compensation Study are, therefore, inconclusive and AVR has not complied with D. 12-09-004, OP 11.

31 D.12-09-004, Ordering Paragraph (OP) 11.
ORA recommends the Commission approve ORA’s General Office Operating Payroll of $4,322,235. Park Water Company (PWC) is not proposing any increase to the headcount of its General Office positions. ORA recommends that the Commission approve PWC’s actual 2.75% payroll increases for 2014% plus scheduled promotions for 2014 and 2015, and ORA’s projected CPI-U increase of 1.3% for Test Year 2015.

C. DISCUSSION

1) AVR’s Payroll Requests

AVR is requesting an employee count of 42 regular positions and 1 part-time position for Test Year 2015. AVR has been able to accomplish a reduction in the employee head count from that last authorized by the Commission in D.12-09-004 through a combination of retirements, reorganization, reassignment of duties, and increased reliance on technology.

As explained further below, AVR’s Engineering Department has one Engineer and proposes one new position of Civil Engineer Intern.

a) AVR’s Payroll Methodology

For Test Year 2015, AVR arrives at its requested Test Year 2015 payroll expense by (1) forecasting AVR’s expected staffing level; and (2) escalating all costs to AVR’s requested Test Year 2015 level by 3.0% annually for 2014 and 2015. Of this amount, 2% is an estimated cost of living (“COLA”) increase effective January 1 of each year, 2014 and 2015, and a 1.0% merit raise projected to be given on April 1st of each year to all employees.

On December 8, 2014, the Compensation Committee, in consultation with senior management of PWC and its subsidiaries, including AVR, approved a zero cost of living increase for PWC and AVR employees. PWC further informed ORA that it had approved a 2014 merit increase of 2.75%.

---

32 PWC Board of Directors’ Meeting Minutes, December 18, 2013, p. 2.
AVR estimates its payroll expenses for its service area in this GRC on an individual employee basis. AVR then assigns the costs for each employee to various expense categories, e.g., Operations, Customers, Maintenance, and Administrative and General (“A&G”). AVR’s calculations use the same approximate distribution observed for 2013 recorded labor costs to assign labor costs among each of the four categories for calendar years 2014 through 2015, with insignificant differences due to changes in the labor distribution caused by AVR’s requested additional position.

ORA reviewed AVR’s allocation/cost assignment methodology and finds that it produces reasonable results. ORA uses the same labor distribution as AVR to assign labor costs to expense categories to develop the Test Year 2015 estimate.

b) Labor Escalation Rates
AVR estimates its payroll for 2014 based on the employees' hourly rates in effect at the end of 2013, an estimated 2.0% 2014 COLA increase, a 2014 one percent (1%) merit salary adjustments to be granted to individual employees, overtime by individual employees and scheduled promotional increases. The payroll for Test Year 2015 is estimated similarly beginning with the hourly rate expected at the end of year 2014 and assuming a COLA increase of 2.0% and merit raise of 1%.

c) New Positions Authorized in the Previous Rate Case
In the previous rate case (A.11-01-001, D.12-09-004) the Commission authorized an employee count of 47 full-time positions including four new positions of Customer Service Representative, Water Audit Conservation Specialist, Asset Management Project Coordinator, and Water Quality Specialist. AVR did not fill the position of Water Audit Conservation Specialist and now proposes to eliminate this position.
AVR requested the position of Water Audit Conservation Specialist and
the Commission authorized one to meet requests from customers for water audits,
which consists of reviewing current usage, informing the customer on indoor and
outdoor water consumption and possible ways to conserve water, including how
to adjust their sprinkler timers and reduce water runoff. At the time of the
previous rate case, AVR reported that it had experienced an increase in the
number of requests for customer assistance with irrigation systems and there was
also an increasing number of high water bill special reads which increased the
number of water audits performed. During this time, the meter-reading
department performed several water audits and had been unable to satisfactorily
complete maintenance work.

AVR now states in its Revenue Requirements Report\textsuperscript{33} that it does not
intend to fill this position because it believes that existing personnel
(Conservation Coordinator, Meter Readers, and Customer Service
Representatives) can handle the demand for water audits.

Because of the completion of its Automated Meter Reading
(“AMR”) Program and the revision to AVR’s rules which allows
disconnect notices to be mailed versus provided as a door-hanger,
meter readers have more time for maintenance functions and can
also handle customer requests for audits. As previously discussed,
customers were calling to request water audits to conserve water and
apply for conservation incentives and rebates. The position of
Conservation Representative is responsible for responding to
customer requests and actively promoting AVR’s conservation
programs (see discussion of conservation programs in Chapter II) in
the community. Additionally, the Company has cross trained the
position of Customer Service Representative to assist with water
audits when needed. Further, customers have become accustomed to
AVR’s conservation programs including tier water rates and the very
successful “Cash For Grass” Program (also discussed in Chapter II)
resulting in a decrease in the number of customer requests for water

\textsuperscript{33} At p. 36.
audits. For the above reasons, AVR will not fill the position of Water Audit Conservation Specialist.\textsuperscript{34}

In D.12-09-004, the Commission made the salaries refundable (through credit of the salary to the Water Revenue Adjustment Mechanism Balancing Account) if a new position remained vacant or in the event that a new position was filled with an existing employee but that employee’s former position was vacant. AVR has not only refunded the payroll associated with the Water Audit Conservation Specialist, but also that of the position of the Fixed Asset Analyst I (for the period of January through August 2012 when the position was vacant) through adjustments to the WRAM balancing account. “The refund for the position of Fixed Asset Analyst I was necessary because an existing employee was promoted to the new position of Asset Management Coordinator leaving the employee’s former position vacant.”\textsuperscript{35} AVR explains in its Application that the other new positions authorized by the Commission (Customer Service Representative, Asset Management, Project Coordinator, and Water Quality Specialist) were filled and therefore no further refunds of payroll are necessary.

d) \textbf{Vacant Positions}

AVR explains that, due to reorganization, it is eliminating the following positions: Superintendent of Operations, which became vacant through a retirement; Warehouse/Facilities/Fleet Maintenance, which AVR has combined with the position of Meter Reading Foreperson; and Asset Management Supervisor, which became vacant due to a resignation. AVR says that it can accomplish the duties of these positions through reorganization and reassignment of duties to other employees and, therefore, does not plan to fill these positions.

\textsuperscript{34} Id. at p. 37.

\textsuperscript{35} Id.
e) New Positions

AVR requests the addition of one part-time position, Civil Engineer Intern, which AVR asserts is necessitated by the aforementioned reorganization and realignment of various duties, which is functionally related to the Company’s ability to not replace existing positions.

AVR’s Engineering Department has one Engineer and proposes one new position: a Civil Engineer Intern. The position of Engineering Intern is designed to “assist the Engineer in various civil engineering tasks related to the water system and with day to day functions. In general, the primary purpose of having this intern is to provide a cost effective way to complete repetitive engineering tasks associated with the design of main replacement and main extension projects. These projects range from the conceptual/preliminary design phase, final design, and project close out to as-built completion.”\(^{36}\) AVR says that some of the typical tasks the Engineering Intern will perform are as follows: as-built research; update as-built information in the data base; gather preliminary design information; QA/QC of as-builds and project close out; answer water availability and new development inquiries; provide maps, standard drawings, rate schedule and review fees to development projects; follow up and provide maps to as-built requests; provide utility research, will serve letters, and Engineer’s estimates; update standard drawing and specifications Easement acquisition; research title reports; coordinate fire flow requirements with Apple Valley Fire Prevention Department; gather data and maps for Conditions of Approval letters to Town of Apple Valley; and coordinate with Town of Apple Valley for its capital improvement projects.\(^{37}\)

ORA accepts AVR’s proposed payroll positions as reasonable because AVR proposes to decrease the number of employees as compared to the employee count last authorized by the Commission in D.12-09-004. ORA also accepts

\(^{36}\) AVR Revenue Requirements Report, p. 38.

AVR’s actual 2014 COLA (0%) and merit raises (2.75%) as more reasonable when compared with AVR’s proposed factors of 2% and 1%, respectively. ORA recommends a 1.3% escalation of 2014 payroll to Test Year 2015, and 1.7% for 2016, based on the ORA ECOS’ March 2014 memo estimate of the Labor Consumer Price Index (CPI-U), consistent with ORA’s GRC forecasting methodology. ORA’s calculations also include AVR’s scheduled promotional increases for 2014 and 2015.

f) ORA’s Recommended and AVR Requested Payroll

Table 4-A below shows a comparison of ORA’s recommended and AVR’s requested payroll expenditures for AVR operating service area.

2) General Office Payroll Requests

PWC is requesting an employee count of 32 regular positions and 2 part-time intern positions for Test Year 2015. This is the same head count (regular positions) last authorized by the Commission for the General Office in

---

38 Includes AVR Operating Division Payroll, Labor Direct Charged from Other Divisions, and allocated General Office Payroll. Excludes costs of one additional General Office employee ORA recommends in lieu of the Power Plan in the amount of $209,000 (Total Company, prior to allocation to AVR.) See Section B, General Office Payroll.
D.12-09-004. PWC’s payroll calculations include the new position of Water Quality Engineer. However, this new position does not represent an increase in head count due to the retirement of the position of Consulting Engineer Emeritus. Additionally, there are several new positions that result from reorganization or promotion that do not represent additions to head count including the positions of Benefits Manager, Director of Human Resources, Senior Network Engineer, Control Systems Engineer, and Chief Information Officer/Assistant VP.

PWC has thus been able to accomplish a reduction in the employee head count from the last authorized by the Commission in D.12-09-004 through a combination of retirements, reorganization, reassignment of duties, and increased reliance on technology.

PWC has also included in its Test Year 2015 payroll estimates the cost of two Interns to assist with the sustainability analysis of PWC’s operations. PWC explains that it found it necessary to hire these in 2013 to provide technical support to its executive staff for special projects and is creating the position of Intern in this GRC.

a) PWC’s Payroll Methodology

PWC estimates its General Office payroll expenses in this GRC on an individual employee basis as of year-end 2013. PWC then escalates its payroll for projected increases for 2014 and Test Year 2015. PWC then assigns the costs for each employee to various expense categories, e.g. Operations, Customers, Maintenance, and Administrative and General (“A&G”). PWC’s calculations use the same approximate distribution observed for 2013 recorded labor costs to assign labor costs among each of the four categories for calendar years 2014 through 2015, with insignificant differences due to changes in the labor distribution caused by PWC’s requested additional position.

ORA reviewed PWC’s allocation/cost assignment methodology and finds that it produces reasonable results. ORA uses the same labor distribution as PWC
to assign labor costs to each of the three expense categories to develop the 2015
Test Year estimates.

b) Labor Escalation Rates
PWC estimates its payroll for 2014 based on the employees' hourly rates in
effect at the end of 2013, the estimated 2.0% COLA increase estimated for 2014,
an estimated 1% merit salary adjustments to be granted during 2014 by individual
employees, overtime by individual employees and scheduled promotional
increases. The payroll for Test Year 2015 is estimated similarly beginning with
the hourly rate expected at the end of year 2014 and assuming a COLA increase of
2.0% and merit raise of 1%.

In contrast, ORA uses the actual 2014 COLA increase of zero and merit
raises of 2.75%. ORA further escalates PWC’s payroll by the estimated CPI-U
increase of 1.3% for Test Year 2015. ORA’s calculations also include PWC’s
scheduled promotional increases for 2014 and 2015.

c) New Positions
As previously mentioned, PWC has also included in its Test Year 2015
payroll estimates the cost of two Interns to assist with the sustainability analysis of
PWC’s operations. PWC explains that it found it necessary to hire these interns in
2013 to provide technical support to its executive staff for special projects and is
creating the positions of Sustainability Analyst Intern in this GRC. However, the
addition of these two new positions does not increase PWC’s headcount. PWC
has accomplished this through a combination of retirements, reorganization,
reassignment of duties, and increased reliance on technology.

ORA accepts PWC’s proposed General Office payroll positions as
reasonable because PWC proposes to decrease the number of employees as
compared to the employee count last authorized by the Commission in
D.12-09-004. ORA also accepts PWC’s actual 2014 COLA (0%) and merit raises
(2.75%) as more reasonable than the COLA and merit increases PWC proposed in
its GRC Application. ORA recommends a 1.3% escalation of 2014 payroll to Test Year 2015, and 1.7% for 2016, based on the ORA ECOS’ March 2014 memo estimate of the Labor Consumer Price Index (CPI-U), consistent with ORA’s GRC forecasting methodology.

Consistent with ORA’s recommendation to exclude PWC’s request to include the cost of Power Plan, ORA adds to its payroll estimate the costs of one additional position. PWC identified the costs of this position as necessary in the absence of Power Plan. As noted in the Table below, this results in $209,279 of additional costs for labor, taxes, benefits, and insurance.

d) ORA’s Recommended and PWC’s Requested General Office Payroll

Table 4-B below shows a comparison of ORA’s recommended and AVR’s requested General Office payroll expenditures.

D. CONCLUSION
The Commission should adopt ORA’s forecast of AVR’s labor expenditures for Test Year 2015 in the total amount of $3,781,573 and ORA’s
forecast of General Office labor expenditures in the total amount of $4,322,235, because they are fair and reasonable.
CHAPTER 5: PENSIONS AND BENEFITS EXPENSES

A. INTRODUCTION

This chapter discusses ORA’s review of Pensions and Benefits (“P&B”) for Test Year 2015. Unless otherwise indicated, all discussions apply to AVR’s operating service area, General Office, and Irrigation District. P&B are comprised of a variety of financial benefits available for employees during employment and upon retirement. P&B include a Group (defined benefit) Pension plan, 401(K) defined contribution plan, 401(A) defined contribution plan, medical & dental insurance and post-retirement benefits other than pensions (“PBOP”).

ORA reviewed AVR’s workpapers, pension consultant actuarial reports, recent insurance contract billings, responses to ORA data requests and other information contained in AVR’s testimony. The following discusses the P&B expenses in which ORA recommends differing estimates for the Test Year.

B. SUMMARY OF RECOMMENDATIONS

1) PBOP

ORA recommends lowering the 2015 Test Year estimate of PBOP expense for AVR from $41,547 to $35,597. For the General Office, ORA recommends increasing the 2015 test year estimate from $52,732 to $61,301.

2) Medical Insurance Premiums

ORA recommends lowering the 2015 test year estimate of medical insurance expense for AVR from $605,868 to $596,220. ORA recommends an estimate of $421,440 for the General Office in the 2015 Test Year.

3) Dental Insurance

ORA recommends lowering the 2015 Test Year estimate of dental insurance expense for AVR from $47,796 to $46,332. ORA recommends an estimate of $28,908 for the General Office in the 2015 Test Year.

4) 401(K) Plan

ORA recommends lowering the 2015 Test Year estimate of 401(K) employer contribution expense for AVR from $79,261 to $69,720. ORA
recommends an estimate of $113,421 for the General Office in the 2015 Test Year.

5) EAP/Wellness Program

ORA recommends lowering the 2015 Test Year estimate of EAP/Wellness Program expense for AVR from $22,269 to $5,351. ORA recommends an estimate of $4,224 for the General Office in the 2015 Test Year.

6) Defined Contribution-401(A) Plan

ORA recommends lowering the 2015 Test Year 401(A) employer contribution expense for AVR from $77,276 to $56,632. ORA recommends an estimate of $29,745 for the General Office in the 2015 Test Year.

7) Irrigation District Net Benefits Adjustment

ORA recommends an Employee Benefits Net Benefits Adjustment of $2,030 for 2015 in the Irrigation District.

C. DISCUSSION

AVR’s Group Pension and Medical Insurance costs are subject to balancing account treatment thereby mitigating the effect of test year forecast errors. These balancing accounts have the effect of protecting customers by ensuring AVR does not benefit from an overestimation of these expenses in the test year. In this general rate proceeding, AVR requests Commission authorization to continue its Employee and Retiree Healthcare Balancing Account to track differences between authorized employee and retiree healthcare expenses included in rates in this proceeding and the costs actually incurred. AVR also requests in this proceeding Commission authorization to continue its Pension Expense Balancing Account to track differences between authorized pension contributions included in rates in this proceeding and the costs actually incurred.

---

39 D.12-09-004 established an Employee and Retiree Health Care Balancing Account and a Pension Expense Balancing Account to record the difference between the actual and adopted expenses.

forecasted costs for pensions and healthcare can differ as a result of market conditions, asset returns, and other factors used by its actuaries in determining pension expense as well as forecast errors made by AVR in estimating total healthcare expenses.

The 2015 Test Year pension expense was not increased over the 2013 estimated amount and is commensurate to the funding estimate prepared by AVR’s actuarial consultant and provided to ORA for review.

ORA found the estimates for Life, Accident Insurance, and Long-Term Disability Insurance reasonably forecasted. Any differences between ORA and AVR are due to differing payroll estimates.

1) **PBOP**

PBOP expenses for ratemaking purposes are based on allowable tax deductible contributions into a VEBA and 401(h) plans in accordance with actuarial valuations determined by AVR’s actuary. The 401(h) component of the PBOP expense is applicable to key employees. Under ERISA rules, the funding for this component of PBOP is on a pay as you go basis and not pre-funded.

AVR’s application provided for a total estimated PBOP funding of $41,547 for the test year. Total PBOP expense is comprised of two parts; the actuarial funding and key employee funding components. The total estimated expense of $41,547 was lowered to $35,597 after AVR discovered that the key employee funding component of PBOP for AVR contained in the application workpapers was erroneously carried over from its previous general rate case. AVR provided ORA with the corrected calculations.

---

41 AON Hewitt.

42 A VEBA is a health reimbursement arrangement that allows an employer to contribute money to a trust on behalf of its employees. The funds in this account can be used to help pay for eligible medical expenses.

44 AVR’s response to ORA Data Request JRC-001, Q. 2.
component of PBOP was $6,100 (for AVR), but was later revised to $150. 
Likewise, the General Office application provided for a total PBOP funding of 
$52,732 which included the key employee funding component of $9,600. The key 
employee funding portion was later revised to $18,169, and the total PBOP 
funding increased to $61,301 for the same reason discussed above.

2) Medical Insurance Premiums

AVR escalated medical insurance monthly premiums by 7.25% to arrive at 
the test year estimate. ORA recommends using a 5.5% inflation factor instead of 
7.25% used by AVR. This lower factor was obtained from the March 2014 Global 
Insight U.S. Economic Outlook (Health Insurance Benefits) and is recommended 
in order to be consistent with industry wide cost trends. Further, ORA used the 
latest (actual) monthly insurance premium rates effective January 1, 2014 
provided by AVR. AVR used projected monthly premiums in the preparation of 
its application. The combined result is to lower the test year estimate from 
$605,868 to $596,220 for AVR. For the General Office, the 2015 estimate is 
$421,440 using the same methodology.

3) Dental Insurance

AVR escalated dental insurance monthly premiums by 5% to arrive at the 
test year estimate. ORA accepted this escalation rate. However, ORA used the 
latest (actual) monthly insurance premium rates effective January 1, 2014 
provided by AVR. The result is to change the test year estimate from $47,796 to 
$46,332. For the General Office, the 2015 estimate is $28,908 using the same 
methodology.

4) 401(K) Plan

AVR offers this defined contribution plan benefit to recently hired 
employees in lieu of its Group Pension Plan (defined benefit). AVR’s 401(K) plan

---

45 AVR’s response to ORA Data Request JRC-001, Q. 3.
46 Id.
is a voluntary contribution plan, and AVR matches a maximum 3% of employees’ contributions. The 2015 projected expense is based on the maximum 3% rate applied to the total projected payroll of 44 employees (AVR) using their current election effective January 1, 2014. AVR’s 2015 estimate is 14.4% larger than the 2012 historical expense of $65,218. Therefore, AVR’s test year estimate assumes that employees will take greater advantage of AVR’s matching of their 401(K) contributions in 2015 than they did in 2012. ORA recommends lowering the 2015 estimate for AVR from $79,261 to $69,720 which is the inflation adjusted five-year average of $67,808 escalated by ORA’s Energy Cost of Service Branch (“ECOS”) memorandum dated March 25, 2014 labor escalation rates for 2014 and 2015 (1.5% and 1.3% respectively). ORA’s estimate is preferred because it takes into account the historical contributions to retirement defined contribution savings. For the General Office, the 2015 estimate is $113,421 using the same methodology.

5) EAP/Wellness Program

ORA forecasted AVR’s EAP/Wellness expense using AVR’s inflation-adjusted 5-year average and escalating it by ORA’s ECOS Branch’s escalation labor factors (memorandum dated March 25, 2014) for 2014 and 2015 (1.5% and 1.3% respectively). AVR used a “2014 budgeted” amount of $21,620 and escalated it by 3%. ORA’s estimate using a 5-year inflation-adjusted average is more reasonable than AVR’s “budgeted” amount for 2014 because the historical expenses are known and certain while AVR’s “budgeted” amounts may not be prudently spent in the future. Given the substantial increase AVR requests for this expense, the inflation-adjusted historical amounts are preferable as a basis to estimate the test year expense. ORA recommends lowering the test year estimate for AVR from $22,269 to $5,351 which is the inflation adjusted five-year average

---

47 AVR’s Revenue Requirement Report, p. 51, and AVR’s Workpapers p. 4-198.
of $5,204 escalated by 1.5% for 2014 and 1.3% in 2015. For the General Office, the 2015 estimate is $4,224 using the same methodology.

6) Defined Contribution-401(A) Plan

Non-Elective Compensation (NEC) is a defined contribution plan offered to employees hired after May 3, 2005 and who work a minimum of 1,000 hours per year. AVR contributes an annual amount on a per employee basis. AVR’s test year estimate is based on the 2013 actual cost per employee escalated by 3% for 2014 and 2015, or $3,220 per employee. ORA estimated 401(A) expense using AVR’s inflation adjusted five-year average of $55,079 and escalating it by ORA’s ECOS Branch’s labor escalation factors (memorandum dated March 25, 2014) for 2014 and 2015 (1.5% and 1.3% respectively). The 2015 Test Year 401(A) expense for AVR should be lowered from $77,276 to $56,632. For The General Office, the 2015 estimate is $29,745 using the same methodology.

7) Irrigation District Net Benefits Adjustment

ORA recommends an Employee Benefits Net Benefits Adjustment of $2,030 for 2015 in the Irrigation District. This compares to $2,063 as estimated by AVR. This is a technical allocation derived from the applicable Payroll Burden Rates. ORA does not take issue with any of the allocation factors.

D. CONCLUSION

ORA recommends adopting its aforementioned adjusted estimates of P & B as reasonable.
CHAPTER 6: TAXES OTHER THAN INCOME

A. INTRODUCTION

This chapter presents ORA’s analysis and recommendations relating to taxes other than income. Income taxes are discussed in Chapter 7. This chapter discusses taxes resulting from the payment of employee compensation (payroll taxes), and the ownership of plant and property (ad valorem taxes).

ORA and AVR generally do not differ on any methodologies employed to forecast taxes other than income. Differences in total estimated taxes are largely due to differences in related inputs. ORA examined AVR’s methodologies, testimony, and supporting workpapers.

Regulated taxes other than income are comprised of the following items: (1) payroll taxes, and (2) ad valorem, or property taxes. Payroll taxes are comprised of: (1) Federal Insurance Contribution Act (“FICA”), (2) Federal Unemployment Insurance (“FUI”); and (3) State Unemployment Insurance (“SUI”).

B. SUMMARY OF RECOMMENDATIONS

ORA recommends that test year’s taxes other than income be computed using the following parameters and assumptions:

a. Effective payroll tax rates and wage bases used by AVR to forecast payroll taxes were found to be reasonable and should be applied in estimating payroll tax expense. Any differences between ORA and AVR are due to differences in the test year estimate for labor expense.

b. Ad Valorem tax expense methodologies were found to be reasonable and should be applied in estimating property taxes. Any differences between AVR and ORA are due to differences in the test year’s estimated plant levels.

C. DISCUSSION

1) Payroll Taxes

Payroll taxes were estimated based upon rates and limitations applicable in 2014. The appropriate rates are applied to forecasted payroll for 2015 (test year)
to arrive at the test year estimated payroll taxes. Payroll rates and limitations used by AVR, as well as AVR’s methodology to estimate payroll taxes, were found to be reasonable. Payroll taxes consist of (1) Federal Insurance Contribution Act (“FICA”) which includes Social Security tax and Medicare, (2) Federal Unemployment Insurance (“FUI”), and (3) State Unemployment Insurance (“SUI”). Differences between ORA and AVR are due to different levels of forecasted payroll expense for the test year.

2) **Ad Valorem Taxes**

AVR’s test year estimate for ad valorem taxes is based upon the methodology used by the San Bernardino County Assessor’s Office, and the ad valorem tax rates currently in effect. The estimated assessed values are calculated based on the estimated plant additions, retirements, advances, contributions, construction work in progress, and materials and supplies.

ORA analyzed AVR’s method of estimating ad valorem taxes for the test year and found its methodology rational and reasonable. The differences between ORA’s ad valorem tax estimate and AVR’s is solely due to differences in net plant estimates.

**D. CONCLUSION**

There are no methodological differences between ORA and AVR for computing taxes other than income. ORA recommends that the Commission adopt ORA’s estimates of taxes other than income.
A. INTRODUCTION

This chapter presents ORA’s analysis and recommendations relating to income tax expense. Taxes Other Than Income are discussed in Chapter 6. Income tax expense is similar to any other expense category in a general rate case filing in that it is a cost of service. However, it is unique in that estimating income tax expense is not merely a matter of reviewing historical payments and then applying objective projection criteria in order to estimate test year expense. Income tax expense is the composite of projected taxable income streams, booked expenses, special tax deductions, and tax credits, calculated within the combined contexts of “real world” tax law and “regulatory world” tax policy (income taxes).

ORA and AVR generally do not differ on any methodologies employed to forecast income tax expense. Differences in total estimated taxes are largely due to differences in related inputs. ORA examined AVR’s methodologies, testimony, and supporting workpapers and responses to ORA data request(s).

Regulated income tax expense is comprised of the following items:

1. Federal income taxes (“FIT”), and California Corporate Franchise Taxes (“CCFT”).

B. SUMMARY OF RECOMMENDATIONS

ORA recommends that the test year income tax expense be computed using the following parameters and assumptions:

a. For federal income tax purposes, the corporate tax rate of 34% should be used to compute FIT. AVR used the same FIT rate.

b. For state income tax purposes, the corporate tax rate of 8.84% should be used to compute CCFT. AVR used the same rate.

---

These parameters and assumptions should also be applied to the escalation years 2016 and 2017.
c. All federal and state tax timing differences should be flowed through to the ratepayer to the extent allowed by Commission policy, and federal and state tax laws.

d. ORA concurs with AVR’s methodology for computing the Qualified Production Activities Deduction. Any differences between ORA and AVR are due to differences in forecasted revenues, plant levels, and water production mix.

e. ORA recommends that the effects of the American Taxpayer Relief Act of 2012 related to the extension of Bonus Depreciation be incorporated into the computation of regulated taxable income and the deferred taxes for the years 2012-2015. It is ORA’s understanding that AVR does not oppose this methodology. ORA further recommends that any revenue requirement impact of the Bonus Depreciation in 2013 be captured in the Tax Memorandum Account established by Resolution L-411A.\footnote{Resolution L-411A established a one-way memorandum account to track the impacts of the Tax Relief, Unemployment Insurance Reauthorization, and Job Creation Act of 2010. The memorandum account applies to all cost-of-service rate regulated utilities that do not address the new tax law in a 2011 or 2012 test year.}

f. ORA recommends that any changes in federal and state tax laws made before the close of the record in this proceeding be incorporated into the tax estimates for the test year, after review of the new law(s) by ORA.

C. DISCUSSION

The following section provides a brief background of regulated income tax expense and a discussion of certain specific tax deductions, credits and other tax policy issues applied in determining taxable income for ratemaking purposes. Unless otherwise noted, all discussions apply equally to both federal and state tax expense.

1) Basis for Regulated Tax Expense

While the mathematical model used to calculate tax expense is seemingly unequivocal, the underlying accounting conventions, applicable tax rates, and the determination of what constitutes allowable deductions necessarily are a function
of current FIT and CCFT tax laws, including new laws expected to affect the test year. In addition, forecasted tax expense is based on adopted regulatory tax policy as determined by numerous Commission decisions, and ORA recommended tax policies. Much of existing Commission tax policy was established in Order Instituting Investigation 24 (“OII 24”), D.84-05-036, 15 CPUC 2d 42 (1984). Numerous subsequent decisions adopted a variety of changes in ratemaking tax policy in order to comply with changes in federal and state tax laws.

The goal of ORA is to minimize tax expense, therefore, minimize revenue requirements for taxes. Another way to articulate ORA’s goal is that the test year’s income tax expense estimate should reflect, to the extent possible, the current (test year) deduction of expenses in which there is a book/tax timing difference. In D.84-05-036, the Commission stated, “[f]or the present, we will continue our current policy regarding flow-through treatment of timing differences consistent with applicable tax law.” ORA recommends that the Commission continue to adopt policies which result in the test year tax estimate reflecting, to the extent possible, the flow-through of forecasted expenditures. It is important to note that in most cases, it is the regulated utility’s parent corporation which actually pays the income taxes of the regulated utility as part of a consolidated or combined income tax return. However, it is ORA’s position and the Commission’s policy that the regulated utility’s taxes are determined on a stand-alone basis, and not based on the actual tax liability of the parent corporation.

2) FIT Deduction for Prior Year’s CCFT

The amount of CCFT allowed as a deduction for FIT purposes by the Internal Revenue Service (“IRS”) is not the current year’s CCFT. The amount allowed on the FIT return is the prior year’s CCFT liability. This creates a timing difference between when the payment of the CCFT is made and when it is allowed as a tax deduction.

This issue was addressed in Phase II of a PG&E general rates case; A.85-12-050 (I.86-11-019). D.89-11-058, issued on November 22, 1989, requires
that for ratemaking purposes, the prior year Commission adopted CCFT number be used as the deduction for CCFT taxes in arriving at FIT taxable income in the test year. However, in many cases, the current or test year estimated CCFT number may be used as a test year FIT deduction. This is particularly true when there is no firm prior year’s payment information or the prior year’s amount is merely an estimate based on progressive annual estimates. AVR used the present (test year) estimate CCFT number as a 2015 deduction for FIT purposes. ORA concurs with AVR on this method because it yields a reasonable result. Therefore, the CCFT estimate for 2014 will not be used as a deduction in arriving at the 2015 test year’s estimated FIT.

3) Tax Normalization

Normalization is a ratemaking concept, which aims to adjust a utility’s operating expenses in the test year by eliminating abnormal, non-annual events that are known and certain to change in a regularly recurring manner. For example, accelerated depreciation is a tax expense, which is normalized over the life of an asset when computing ratemaking tax expense. It is known and certain that toward the end of the life of an asset, straight-line (book) depreciation will exceed accelerated tax depreciation. However, at the conclusion of the asset’s life, the total depreciation charges under both book and tax methods will be equivalent.

Income tax normalization permits a utility to include in its current ratemaking expense, an amount of income tax expense that is higher than what the utility will actually pay. This is based on the theory that the taxes saved by the accelerated depreciation (taken on the real world tax returns) are merely deferred. Utilities generally use accelerated methods of depreciation on their real world tax returns, while using the straight-line method for book purposes. IRS rules require that utilities use book depreciation rates on all plant purchased or constructed after 1980 when computing regulated tax expense. To mitigate the effect of normalization, the tax effect of the differences between accelerated and straight-line depreciation is booked to a deferred tax reserve. The deferred taxes are used
to reduce rate base. Another example of normalization in this general rate case is
the computation of deferred income taxes for both FIT and CCFT purposes related
to the tax accounting changes related to the deduction for Repair Costs. The
deductions for certain capital investment costs are to be captured in a deferred tax
account and deducted from ratebase to lower revenue requirements. This issue is
discussed further below.

4) **Tax Depreciation**

For FIT purposes, tax depreciation for all post-1980 plant has been
normalized using book lives and rates. For 1980 and prior years’ plant, the
appropriate accelerated depreciation has been flowed through. For CCFT
purposes, tax depreciation has been flowed-through in estimating CCFT taxable
income. Tax depreciation for ratemaking purposes does not include depreciation
on plant costs disallowed in previous rate cases.

5) **American Jobs Creation Act of 2004**

In terms of both impact and number of provisions, the American Jobs
Creation Act of 2004 ("Act") is one of the most significant reforms of U.S.
business taxation. The act created a new tax deduction for manufactures and
added new Section 199 to the Internal Revenue Code ("IRC"). Congress broadly
defined the term "manufacturers" as well as the underlying (qualifying)
"production activities" to include Class A water utilities and their well production
activities. Generally, the deduction is referred to as the Qualified Productions
Activity Deduction ("QPAD").

The deduction is equal to a specified percentage applied to the lesser of (1)
qualified production activity income for the year, or (2) taxable income for the
year. The deduction started at a transition percentage of 3% for 2005 and 2006,
6% for 2007 through 2009 and later fully expanded to 9% in 2010.

The impact of the legislation is that many water utilities qualify as
"manufacturers" to the extent that they pump well water for distribution to
customers. The Act defines production of potable water as a manufacturing activity. AVR calculates the QPAD by applying the 9% statutory rate to its production related portion of taxable income. The percentage of AVR’s taxable income that is production related is calculated using a percentage (37.81%) developed by AVR’s outside accountants in the preparation of AVR’s federal tax return. AVR’s methodology was examined by ORA in its prior general rate case and found to be reasonable. There have been no departures from the prior methodology since the last rate case.50

The deduction is a permanent item and not subject to a timing difference. As such, it should be fully flowed through to ratepayers in the form of an immediate tax deduction (schedule M adjustment). ORA reviewed AVR’s methodology to calculate the deduction for the Test Year 2014, and found it to be reasonably forecasted. Any differences between ORA and AVR are due to differences in forecasted revenues, plant levels, and water production mix.

6) Interest Expense
For FIT purposes, interest expense was estimated by applying the weighted average cost of debt to total ratebase including working capital. Differences in the total amount of interest expense deductible for regulated income tax purposes are, therefore, the result of differing rate base estimates between AVR and ORA.51 The unamortized deferred investment tax credit (ITC, discussed below) balance was deducted from rate base for this calculation. The method of “interest synchronization” does not apply to AVR because it is an “option 1” company (see below).52 For CCFT purposes, the unamortized ITC was also deducted from rate base by ORA and AVR before applying the same debt cost factor.

---

50 AVR response to ORA Data Request JRC-001.
51 In some cases, the differences in computed interest expense would also stem from differences in the computed weighted average cost of debt if this issue were included in the rate case.
52 With Interest Synchronization, deferred ITC is not deducted from ratebase resulting in a larger tax deduction for interest expense. This is because the cost of debt factor is applied to a larger
7) **Investment Tax Credit ("ITC")**

FIT expense was not reduced by the annual amortization of ITC. Under current federal tax law, ITC must be amortized over the life of the underlying plant when estimating regulated federal income tax expense. Generally, this method of normalizing ITC applies to plant placed in service after 1980. Public utility corporations have two normalization methods to choose from when electing a method to amortize ITC for regulated tax purposes. Under option one, the tax benefits of ITC are flowed through to ratepayers by deducting deferred ITC from rate base; as each year passes, the deferred ITC balance decreases, thereby ratably restoring rate base over the book life of the plant which generated it. Under option two, the tax benefits of ITC are ratably flowed through as a direct reduction of estimated FIT. Because AVR uses option one, ORA is precluded from diverting from this method of ITC amortization.

**D. CONCLUSION**

All tax benefits should continue to be flowed through to the ratepayer to the extent possible under the Internal Revenue Code and CPUC tax policy. There are no methodological differences between ORA and AVR for computing income taxes. ORA recommends the Commission adopt ORA’s estimates of income taxes.
CHAPTER 8: UTILITY PLANT IN SERVICE

A. INTRODUCTION

This Chapter sets forth ORA’s analyses and recommendations for AVR’s utility plant investment requests in its GRC Application 14-01-002 (“A.14-01-002”). ORA reviewed and analyzed AVR’s testimony, Minimum Data Requirements, workpapers, capital project details, several technical reports pertaining to mains, storage, and supply, and responses to ORA data requests. ORA also conducted a field investigation of proposed plant additions before making its own independent estimates.

Section B below provides a summary of ORA’s recommendations on AVR’s plant investment requests presented in Chapter VI of AVR’s Revenue Requirement Report. Section C presents a detailed discussion of ORA’s recommended adjustments to AVR’s requested plant additions. Section D presents ORA’s conclusions. Section E presents ORA’s recommended adjustments to AVR’s plant investment requests in the General Office, as presented in Chapter V of AVR’s General Office Report.

A. SUMMARY OF RECOMMENDATIONS

Table 8-A presents AVR’s and ORA’s plant-in-service estimates for 2014-2016. AVR estimates $124.1 million Plant in Service for 2014, $134.8 million for Test Year 2015, and $149.7 million for Test Year 2016. ORA recommends a lower Average Plant in Service of $120.6 million in 2014, $123.9 million in 2015, and $126.2 million in 2016.
Table 8-A

Table 8-B below presents AVR’s and ORA’s estimated plant addition for 2014-2016. ORA’s recommendations are approximately 27% to 55% of AVR’s request in each year. Differences in Average Plant in Service are due to ORA recommending reductions in the capital additions requested by AVR for years 2014 through 2016.

**B. DISCUSSION**

1) **AVR Plant in Service**

AVR has recorded $4,253,210 per year in average gross plant additions during the past five years (2008-2012). The company’s average gross plant addition request for the period of 2013-2016 is $11.8 million per year, which represents a 277% increase over historical recorded plant additions. On a going-forward basis, ORA recommends $4,010,429 per year in average gross plant additions during 2014-2016.

---

53 AVR’s Ratebase 15r.xlsx, AV 5 Yrs Avg Tab, Cell AD55.
ORA presents a discussion on its analyses and recommended adjustments to AVR’s requested plant additions as shown below:

1. New Well #35
2. 1.5 MG Storage tank in Bell Mountain Pressure Zone
3. 1.5 MG Storage tank in Stoddard Pressure Zone
4. New Office Building
5. Mains Replacement Program
6. Vehicle 08-6

2) New Well #35

AVR requests $1.1 million per year in 2015 and 2016 for a total of $2.2 to construct a new well on a previously purchased property. The company stated that the well is needed to “reliably meet water system demands.” The company submitted a copy of the Analysis of Source and Storage Capacity Technical Report (Technical Report) dated June 2013. Based on AVR’s analysis, its wells will not be able to meet the system demand by 2017. In order to determine if AVR’s water system has the capacity to meet customer demands, it is important to look at how the company determined the system’s supply and demand.

---

a) Sources of Supply

AVR’s water system currently has 20 active wells, and one standby well, with a total capacity of 25,505 gpm. Like most water systems, two of AVR’s wells were constructed in the 1950s. AVR evaluated the demand with the various scenarios from losing 15% to 25% of its well supply to taking one to two of the largest producing wells out of service. Based on these scenarios, AVR determined that it would not meet the 2017 maximum daily demand (“MDD”) with its largest well out of service. However, neither GO-103A nor Title 22 of the California Code of Regulations requires that production capacity from the largest well in a water system be discounted when determining adequate supply.

GO 103A, II.B.(1)(b) provides the following requirements for quantity of water:

“Obtained from a source or sources reasonably adequate to provide a reliable supply of water.”

GO 103A, II.B.(3)(c) states the following:

“The system’s MDD and PHD shall be determined in accordance with Waterworks Standards, CCR Title 22, Section 64554, or its successor.”

Section 64554 of Title 22 offers the following requirement:

(a) Water sources shall have capacity to meet MDD.

(i) For systems with 1,000 or more service connections, the system shall meet 4 hours of PHD with source capacity, storage capacity, and/or emergency connections.

It is important to note that Section 64554 neither requires nor makes any mention of taking any source off line to assess the capacity of a system during the MDD or PHD scenario. However, ORA is willing to entertain this scenario (“firm capacity”56) to illustrate that there is enough supply in the system to support a more reasonably forecasted demand as shown below with even the largest

56 Firm Capacity – AWWA defines firm capacity as the ability of a water system to meet the maximum day demand with the largest well out of service.
producing well taken out of service. AVR’s largest well has a production capacity of 3,261 gpm. Removing that from the capacity of 25,505 gpm, the system’s firm capacity is 22,244 gpm, a reduction of 13%.

b) Customer Demand

System demand is the amount of water needed to provide a sufficient source of supply to customers in a water system. The total amount of water delivered to customers in one year divided by 365 days is known as the average day demand (ADD). The maximum day demand (MDD) is the highest amount of water delivered in a single day in that year. AVR’s analyses for its supply reliability premise on its water system’s ability to supply the MDD with considerations for “variations in demand, wells being out of service, declining production capacities, well failures, etc.”

According to AVR’s Technical Report, AVR estimates the daily maximum customer demands will be 22,412 gpm in 2017 and its wells can only supply 22,244 gpm, resulting in a shortage of 168 gpm to meet customer demand. In estimating future customer demand, AVR projected the number of customers with a growth rate of 1% per year and multiplied it by the demand per customer. In 2017, AVR projected the number of customers to be 19,973 with each customer using 1.122 gpm, yielding a maximum system demand of approximately 22,412 gpm.

This is a grossly inflated estimation because consumption has been declining significantly since 2009 due to Commission mandated conservation rates and programs, and impact of economic conditions. In 2013, the maximum amount of water that each AVR customer used is 0.88 gpm. AVR’s projected demand per customer of 1.12 gpm/customer is 27% higher than the recorded 2013 customer demand, despite the fact that AVR recognizes “that the demand per customer has

had a **declining trend** over the years.\textsuperscript{58} This is evident in AVR’s chart below, which shows the amount of water that a customer uses during the maximum day demand. Moreover, in this GRC, AVR expects this trend will continue and forecasts customer usage will decrease by 1.5% per year.\textsuperscript{59}

**Chart 8-A**

**Maximum Day Demand per Customer**\textsuperscript{60}

Since 2009, customer water usage has declined enough for many water utilities to forecast lower customer demand in its consumption estimates. This may be due to the combination of conservation efforts, resulting from conservation rates and programs implemented in 2008, and economic conditions. According to the California Urban Water Conservation Council (CUWCC), when a utility

\textsuperscript{58} AVR’s Analysis of Source and Storage Capacity Technical Report, p. 4.

\textsuperscript{59} AVR’s Revenue Requirement Report, p. 23.

\textsuperscript{60} The recorded mdd/customer data comes AVR’s Analysis of Source and Storage Capacity Technical Report, Table 1, ORA estimated the forecasted mdd/customer data by reducing the 2013 recorded number by 1.5%.
implements a conservation rate structure, it should cause customers to use less water. Customers’ conservation efforts would lead to lower demand on a water system, which would result in a lower or a delay in the need for infrastructure improvements. The CUWCC provided the following explanation:

“The key practical long-term benefit of water conservation is the postponement or deferral of additional treatment and source development capacity. For public utilities, including water suppliers, the incentives to add capacity always have been stronger than the incentives to control demand. Conservation pricing counteracts this tendency by promoting more efficient use of existing facilities.”

[Emphasis added.]

As shown above, AVR’s method of projecting future demand does not take into consideration customers’ conservation efforts and, therefore, resulted in an over-inflated demand. In 2013, the recorded MDD is 16,944 gpm while AVR used an MDD ranging from 19,261 to 22,955 gpm for the year 2013 in its

---

63 AVR’s Response to ORA’s DR JAU-001, Q.1, p. 2.
Given the known effects of SB X7-7 and the trend of water consumption we have been observing, a more realistic and reasonable forecast of future demand would have been at least to start from the 2013 recorded MDD and project a 1% consumption increase per year. The 1% consumption increase is to account for an AVR’s projected increase in the number of customers by 1% per year and an assumption that no further conservation would occur.

**Chart 8-C**  
Projected Maximum Day Demand

Based on AVR’s recorded 2013 MDD, ORA projected MDD for 2017 is 17,632 gpm, which is less than the system’s firm capacity of 22,244 gpm. In addition, ORA also evaluated several scenarios to determine if there is enough supply to meet the demand. One such scenario was the loss of production from eight wells that AVR’s Technical Report identified as being old and/or yielding low capacity. The combined capacity from these wells is 5,455 gpm.

---

64 AVR’s Analysis of Source and Storage Capacity Technical Report, Table 7.  
65 ORA projected the MDD by taking the 2013 MDD of 16,944 gpm and escalating it by 1% per year.  
66 Wells 4, 9, 17R, 20R, 21, 23, 25, and 28 from AVR’s Analysis of Source and Storage Capacity (continued on next page)
Discounting this amount resulted in a total production capacity of 20,050 gpm in the system and, therefore, enough to meet the projected demand of 17,632 gpm in 2017 and 17,808 gpm in 2018 as shown in the chart below.

**Chart 8-D**

**Projected Maximum Day Demand vs. Firm Capacity**

ORA also evaluated whether AVR’s system would be able to meet the average 5-year maximum day demand with its largest well out of service. The projected demand based on the 5-year average MDD is 20,043 gpm for 2017 and 20,243 gpm for 2018. Since the system’s “firm capacity” is 22,244 gpm, it clearly has the capacity to meet the 5-year MDD even with the largest well out of service. It is important to note that the 5-year average MDD used in this assessment is 14% higher than the 2013 recorded MDD and represents a very

---

*(continued from previous page)*

Technical Report, Table 8.

67 AVR’s Analysis of Source and Storage Capacity Technical Report, Table 7.

68 AVR’s Analysis of Source and Storage Capacity Technical Report, Table 7.
conservative estimation of customer usage. Previously, AVR recommended only a 5% increase in MDD when considering “variations in water demand due primarily to weather.”

In the chart below, ORA also evaluated whether AVR’s system would be able to meet the average 5-year with the largest well out of service and the loss of production from Well 4. Well 4 was constructed in 1953 and has a capacity of 1180 gpm. Aside from producing water of poor water quality, AVR has experience casing issues with this well and therefore, will likely take Well 4 out of service in the near future.

**Chart 8-E**

*Increased Maximum Day Demand vs. Reduced Capacity*

---

69 Rick Dalton’s Rebuttal Testimony in A. 11-01-001, p. 21. Mr. Dalton recommended a 5% increase for the 2011 MDD from the 2010 due to weather driven variations in demand based on 2010 having a mild summer. Considering that 2013 is a record dry year for weather and customers typically use more water in dry year, a 5% weather adjusted variations in use should suffice.

70 AVR’s Analysis of Source and Storage Capacity Technical Report, Table 2.

71 AVR’s Analysis of Source and Storage Capacity Technical Report, p. 11.

72 ORA used the 5-yr average MDD and reduced the capacity of the largest well and Well #4.
Without considering the capacity from the largest well and Well 4, AVR’s system is capable of providing approximately 21,064 gpm. As shown in the above chart, AVR’s system is able to meet ORA’s projected demand of 20,043 gpm and 20,243 gpm for 2017 and 2018, respectively.

c) Conclusion

Based on ORA’s analysis, if AVRs customers reverse their practice of conserving water and begin to use 14% more water than they have used in recent years, then AVR will need to construct a well by 2020 at the earliest. The CUWCC also stated that investor-owned utilities’ incentives to add capacity involve “the desire for growth, the emphasis on achieving economies of scale, and the appeal of expanding the capital investment base.”

Although customers are conserving water, which is evident in recorded production data, AVR continues to plan for capital projects based on historically higher usage data rather than recent data. The effects of SBx 7-7 and recent Governor’s executive order for further voluntary conservation efforts are well known, but AVR seems to be ignoring that fact. AVR’s projected 20% reduction by 2020 required gross per capita water use (“gpcd”) is 245 and AVR’s 2012 gpcd is 204. Hence, AVR’s customers have been conserving water at a much higher rate than required by SBx 7-7. Using a higher system demand would result in an exaggeration of the deficiencies used to request the projects. AVR’s use of higher water demand is inconsistent with the historical pattern of lower sales in its water systems. Furthermore, a persistent and major complaint from customers who have reduced water consumption is that they do not see cost savings resulting from their conservation efforts as a result of less need for adding supply infrastructure. Based on the information available, ORA believes that although customers are conserving water as evident in sales data,

---

24 AVR’s Water Transmission Main Study, p. 10, Table 2-4.
ratepayers may not realize any benefits in savings if the company continues to plan for increasing supply infrastructure without considering the results of its customers’ conservation efforts. ORA recommends that AVR defer the construction of this well to the next GRC when more information on customer usage is available in light of a slight improvement in the economy. It is fair and reasonable for ratepayers to realize the benefits of their conservation efforts. Therefore, ORA recommends that the Commission disallow AVR’s request to construct a new well at a cost of $2.4 million in this GRC.

3) **1.5 MG Storage Tank in Bell Mountain Pressure Zone**

AVR requests $2.30 million in 2015 to construct a 1.5 million gallon (MG) storage tank to serve the Bell Mountain Pressure Zone (“Bell Mountain Zone”). The new tank will have a usable volume of 1.2 MG and will be equipped with a mixing system, a chemical feed system, and flexible connections. AVR claims that a bigger tank is needed to meet fire flow capacity in the area and to resolve operational and water quality problems. The Bell Mountain Zone has 21 customers with an average day demand of 7,388 gallons per day (gpd) and is served by a 1.0 MG storage tank, which was constructed in 1988.

a) **Storage Capacity**

In determining whether there is enough storage in the Bell Mountain Zone, ORA referred to GO 103A and the Waterworks Standards (CCR Title 22) for storage requirements.

GO 103A, II.B.(3)(c) states the following:

> “The system’s MDD and PHD shall be determined in accordance with Waterworks Standards, CCR Title 22, Section 64554, or its successor.”

---

25 AVR’s Revenue Requirements Report, p. 80.
26 AVR’s The North Apple Valley Water Systems Improvement Plan, p. 3-1, Table 3-2.
27 AVR’s Analysis of Source and Storage Capacity Technical Report, Table 3.
Section 64554 of Title 22 offers the following requirement:

(b) Water sources shall have capacity to meet MDD.

(ii) For systems with 1,000 or more service connections, the system shall meet 4 hours of PHD with source capacity, storage capacity, and/or emergency connections.

ORA evaluated the operating conditions in the Bell Mountain Zone to determine if they meet the requirements of Section 64554 of Title 22. Condition (i). Do the source capacity, storage capacity, and/or emergency connections meet 4 hours of PHD?

Without even considering source capacity in the zone, ORA considered the amount of storage needed to provide for 4 hours of PHD, which is 4,100 gallons.\(^{28}\) The existing storage tank has a capacity of 1,000,000 gallons and, therefore, has the capacity to meet the required 4 hours of PHD under the requirements set forth in Title 22. It should be noted that CDPH only requires 4 hours of PHD because the Peak Hour Demand does not occur over a 24-hour period of time. Customers do not use the highest amount of water over a period of 24 hours.

Above, ORA showed that there is enough storage in the system based on regulatory requirements contained in Title 22. According to the analysis provided by AVR, the Bell Mountain Zone needs 1.2 MG of storage. AVR based its need on American Water Works Association’s (AWWA) recommended standards to provide for operational, fire flow, and emergency conditions\(^ {29}\). AWWA defines the storage components as:

1. Operational or Equalization – to provide for peak hour flow (20% to 25% of MDD)
2. Fire – to provide for fire flow (typically 2 hours times FF)
3. Emergency – to provide a reserve in case of power outage or

\(^{28}\) PHD is 24,602 gpd or 1025 gph times 4 hours yields 4,100 gal. PHD info is obtained from AVR’s North Apple Valley Water System Improvement Plan, p. 3-1, Table 3-2.

\(^{29}\) AWWA’s Determining Distribution Storage Needs, September 25, p. 8.
AVR claims that its analysis shows that the storage need is 1.2 MG, which is higher than the existing tank’s 1.0 MG of storage capacity. It is important to note that AVR deviated from AWWA’s recommendation when estimating the operational storage. Instead of using 20% to 25% of the MDD as recommended by AWWA, AVR established its own minimum operational criteria and defined it as 20% of the Emergency plus Fire Storage\(^{80}\). AVR’s use of this criterion is problematic because the fire flow used in the analysis is exceptionally high compared to what customers use in this zone. The Improvement Plan evaluated the storage need of the Bell Mountain Zone with a fire flow of 4,000 gpm for 4 hours because this zone serves the Apple Valley Airport\(^{81}\). As shown below, the fire flow storage is the dominant criteria. Over 80% of the required storage need is attributed to fire flow,\(^{82}\) which is due to the airport.

<table>
<thead>
<tr>
<th>Emergency Storage</th>
<th>Fire Flow Storage</th>
<th>Operational Storage</th>
<th>Total Storage Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.003 MG</td>
<td>0.960 MG</td>
<td>0.190 MG</td>
<td>1.16 MG</td>
</tr>
</tbody>
</table>

The Improvement Plan clearly stated that the Apple Valley Airport is served by the Bell Mountain Zone so AVR wants to provide a minimum fire flow of 4,000 gpm. This means that if the Apple Valley Airport is not located in the Bell Mountain Zone, then the fire flow required for the zone will not be 4,000 gpm. Therefore, it is imperative for the Commission to determine who is responsible for providing adequate fire flow in a water system. Neither Title 22 nor GO 103A contain any language regarding fire flow requirements. Even

\(^{80}\) AVR’s North Apple Valley Water System Improvement Plan, p. 5-2.

\(^{81}\) AVR’s North Apple Valley Water System Improvement Plan, p. 4-3.

\(^{82}\) ORA obtained 80% by dividing the fire flow storage by the total storage (0.96 divided by 1.19)

\(^{83}\) AVR’s North Apple Valley Water System Improvement Plan, p. 5-2, Table 5-1.
AWWA does not believe adequate fire flow capacity is the responsibility of a water utility as shown in the following excerpt:

"According to the 10 State Standards, a community is not obligated to provide fire protection. AWWA M31, Distribution System Requirements for fire Protection, also states that there is no legal requirement that a governing body must size its water distribution system to provide fire protection."\(^{84}\)

Based on the AWWA’s statement above, AVR is not obligated to size its water distribution system at the time of construction to provide fire protection, not to mention constructing additional storage to meet fire flow requirement for one entity, namely the Apple Valley Airport. It is more reasonable for Apple Valley Airport to construct its own fire flow storage as the Walmart Distribution Center has in the Stoddard Zone.

Without considering the fire flow need of the Apple Valley Airport, ORA calculated the storage requirements in the Bell Mountain Zone as follows:

<table>
<thead>
<tr>
<th>Operation Storage</th>
<th>0.25*MDD</th>
<th>4100</th>
</tr>
</thead>
<tbody>
<tr>
<td>Emergency Storage</td>
<td>ADD</td>
<td>7388</td>
</tr>
<tr>
<td>Fire Storage</td>
<td>3 hrs FF (3,000gpm)</td>
<td>540,000</td>
</tr>
<tr>
<td></td>
<td></td>
<td>551,488 gal</td>
</tr>
</tbody>
</table>

Although ORA does not agree with AVR’s established criteria for calculating the Operational Storage of 20% of the Emergency plus Fire flow storage, ORA is willing to entertain the evaluation in this case to demonstrate that there is enough storage in the Bell Mountain Zone as shown below:

<table>
<thead>
<tr>
<th>Operation Storage</th>
<th>0.2*(ER+FF)</th>
<th>108,738</th>
</tr>
</thead>
<tbody>
<tr>
<td>Emergency Storage</td>
<td>3,694</td>
<td></td>
</tr>
</tbody>
</table>

\(^{84}\) AWWA’s Determining Distribution Storage Needs, p. 9.
The Bell Mountain Zone needs approximately 652,000 gallon of storage based on AVR’s established criteria and the Zone has a 1,000,000 gallon storage tank, which provides more than adequate storage for the Zone.

b) **Operational Issues**

In addition to increasing the size of the tank, AVR proposed to raise the hydraulic grade line (“HGL”) of the Bell Mountain Zone to match the HGL of the Main Zone by raising the tank elevation by 15 feet. AVR claimed that this would improve pressure flow in the system. Operating conditions of the system were evaluated by modeling different demand scenarios. The results of the hydraulic model indicated that the pressure reading in some parts of the system fell below 30 psi during PHD and the fire flow at the Apple Valley Airport is less than 4,000 gpm. Of the 31 pressure points, only two are shown to be below 30 psi during the peak demand period.\(^{85}\) These two low readings are confined to a small area in the northeast portion of the Bell Mountain Zone where there are no customer connections.\(^{86}\) This area also has a low fire flow. Since there are no customers in the northeast portion of the Bell Mountain Zone, ORA can conclude that the operational issues of low pressure and fire flow do not impact any customers. AVR also wants to provide 4,000 gpm of fire flow to the Apple Valley Airport, which currently gets around 2,200 to 3,800 gpm of fire flow. As ORA discussed above, AVR is not required to provide adequate fire flow to the Apple Valley Airport and it would be more reasonable for Apple Valley Airport to construct its own fire flow storage similar to what the Walmart Distribution Center did in the Stoddard Zone. Thus, ORA asserts that there are no operational issues with the existing tank and AVR has not demonstrated a true need for a new tank.

---

\(^{85}\) AVR’s North Apple Valley Water System Improvement Plan, p. 5-7, figure 5-1.

\(^{86}\) Id., at p. 5-6, Section 5.3.1.
c) Seismic Standards

AVR claims that the existing 1.0 MG tank does not meet current seismic standards set forth in AWWA’s D100-11. Therefore, AVR wants to construct another tank that will meet the current seismic standards. AWWA’s D100-11 recommends that all new steel storage tanks are constructed to provide adequate freeboard and equipped with seismic anchoring, flexible connections, and automatic shut-off valves. AVR claims that the existing Bell Mountain tank, which was constructed in 1988, does not have these features and should be replaced. ORA points out, however, that the seismic standards for steel tanks contained in AWWA’s D100-11 are for new tank construction and do not apply to existing tanks. In upgrading existing tanks for seismic safety, Class A water utilities have chosen to upgrade by adding flexible connections and shut off valves instead of replacing an existing tank that does not have these features. According to the Improvement Plan, AVR currently operates the Bell Mountain tank with an operational freeboard of 3 feet. Based upon the size and dimensions of the existing tank, a freeboard of 5.3 feet is recommended to meet current seismic standards. Increasing the freeboard measurement by another 2.3 feet would reduce the effective volume of the existing tank to 0.77 MG.\footnote{AVA’s North Apple Valley Water System Improvement Plan, p. 6-9, Section 6.2.1}

The Improvement Plan fails to consider the less costly option of retrofitting the existing Bell Mountain tank to current seismic standards. As ORA has shown above, the storage needs in the Bell Mountain Zone is approximately 0.55 MG, which is lower than the effective volume (0.77 MG) of the existing Bell Mountain tank with the AWWA recommended freeboard distance.

d) Water Quality

AVR claimed that constructing a new tank in the Bell Mountain Zone “will solve existing water quality issues”.\footnote{AVA’s Revenue Requirement Report, p. 80.} The Improvement Plan provided the
following excerpts:

"Because the demand in the Bell Mountain Zone is very low, the tank level typically only drops when the Stoddard BPS is turned on. As a result, the tank level fluctuates only slightly and, with a common inlet and outlet and no capability to mix the tank, short circuiting is likely..., which can lead to problems with water quality." \(^{89}\)

"Due to the configuration of the distribution system, the closed valve between the Bell Mountain and Main Zones and the single source of supply via the PRV, short circuiting in the distribution system is also likely, which can lead to problems with water quality." \(^{90}\)

Based upon its analysis, Water Systems Consulting, Inc. ("WSC") concluded that the existing operating conditions of the Bell Mountain tank have the potential to cause water quality problems. However, the Improvement Plan clearly stated that there is no current water quality problem in the Bell Mountain Zone.\(^{91}\) The California Department of Public Health ("CDPH") did not identify any water quality issues in AVR’s system.\(^{92}\) In addition, the Improvement Plan stated that if the amount of storage is increased, there is a potential for water quality issues to occur.\(^{93}\) The implication that increasing the tank size will result in water quality problems seems to indicate too much water will be stored and not used, causing water quality problems to develop. Based on the above, ORA asserts that there are no water quality issues with AVR’s existing tank at this time and AVR’s request is based upon speculation and premature. Moreover, AVR’s own Improvement Plan indicates that increasing the size of the tank increases the potential for water quality problems to develop, which supports ORA’s position that a new larger tank is not necessary at this time.

\(^{89}\) AVR’s North Apple Valley Water System Improvement Plan, p. 6-1, section 6.1.

\(^{90}\) AVR’s North Apple Valley Water System Improvement Plan, p. 6-1, section 6.1

\(^{91}\) AVR’s North Apple Valley Water System Improvement Plan, , p. 5-5, Section 5.2.2.3.2

\(^{92}\) Email from Brenda Pauli of CDPH, dated April 3, 2014.

\(^{93}\) AVR’s North Apple Valley Water System Improvement Plan, p. 6-1, section 6.1.
e) Conclusions

In this request, AVR overstated its needs for storage in the Bell Mountain Zone by including the fire flow storage needs for the Apple Valley Airport. ORA asserts that it is unreasonable for AVR to construct a new tank for the sole purpose of providing adequate fire flow to the Apple Valley Airport when that is not required of AVR. The airport operator is responsible for having adequate fire flow and should construct its own storage as Walmart has done.

AVR discounted the amount of available storage capacity of the existing Bell Mountain storage tank by applying current seismic standards, which are not required for existing tanks. In addition, the operational and water quality issues AVR attempts to solve with this request do not exist and AVR’s request is based upon speculation and premature.

As ORA has shown above, the existing storage tank provides adequate storage for the Bell Mountain Zone. Therefore, ORA recommends that the Commission deny AVR’s request for $2.3 million to construct an additional 1.5 MG storage tank in the Bell Mountain Zone.

4) 1.5 MG Storage Tank in Stoddard Pressure Zone

AVR requests $2.35 million in 2016 to construct a 1.5 million gallon (MG) storage tank to serve the Stoddard Pressure zone. As part of its project justification, AVR submitted a copy of the North Apple Valley Water System Improvement Plan (Improvement Plan) prepared in June 2013 by Water Systems Consulting (WSC) Inc. The Improvement Plan evaluated the storage need in the Stoddard Zone and concluded that the existing 1.0 MG storage does not provide enough storage for the zone and lacks seismic safety features. Thus, AVR’s Improvement Plan recommended the construction of a second storage tank for the Stoddard Zone.
The Stoddard Pressure Zone has 21 customers with an average day demand of 64,926 gallons per day (gpd)\(^94\) and is served by a 1.0 MG storage tank, which was constructed in 1988.\(^95\) In order to determine if a new 1.5 MG storage tank is needed, ORA reviewed the issues of storage deficiency, seismic requirements, and water quality.

**a) Storage Capacity**

The impetus for AVR’s request is to increase the storage capacity in the Stoddard Zone. The utility based its need on the ability to provide for operational, fire flow, and emergency conditions as recommended by the American Water Works Association (AWWA).\(^96\) AWWA defined the storage components as:

4. Operational or Equalization – to provide for peak hour flow (20% to 25% of MDD)
5. Fire – to provide for fire flow (typically 2 hours times FF)
6. Emergency – to provide a reserve in case of power outage or main breaks (ADD)

AVR claims that its analysis shows that the storage need in the Stoddard Zone is 1.2 MG and the existing tank only has 1.0 MG of storage capacity. It is important to note that AVR diverted from AWWA’s recommendation when estimating the operational storage. Instead of using 20% to 25% of the MDD as recommended by AWWA, AVR established its own minimum operational criteria and defined it as 20% of the Emergency plus Fire Storage.\(^97\) The problem with using this planning criteria is that the fire flow required is exceptionally high compared to what customers use (ADD) in this zone. The Improvement Plan evaluated the storage need of the Stoddard Zone with a fire flow of 4,000 gpm for

---

\(^94\) The North Apple Valley Water Systems Improvement Plan, p. 3-1, Table 3-2.
\(^95\) AVR’s Analysis of Source and Storage Capacity Technical Report, Table 3.
\(^96\) AWWA’s Determining Distribution Storage Needs, September 25, p. 8.
\(^97\) AVR’s North Apple Valley Water System Improvement Plan, p. 5-2.
4 hours because this zone serves the Walmart Distribution Center. As shown below, the fire flow storage is the dominant criteria. Over 80% of the required storage need is attributed to fire flow, which is due to the Walmart Distribution Center.

Emergency Storage = 0.030 MG
Fire Flow Storage = 0.960 MG
Operational Storage = 0.200 MG
Total Storage Required = 1.19 MG

The Improvement Plan neglected to take into consideration the fact that Walmart has its own fire storage. This is evidenced in AVR’s Response to ORA’s Data Request JAU-002:

“AVR reviewed the plans for the Walmart Distribution Center prior to construction and informed the Walmart representatives of the lack of adequate fire flow storage within the existing AVR system. Walmart decided to construct their own on-site fire system with storage to augment the firefighting capabilities of the AVR system.”

In addition, even though the Walmart Distribution Center was constructed approximately 10 years ago, the “fire flow requirements have not changed.”

ORA asserts that it is inaccurate for AVR to include the fire flow capacity requirements for Walmart in its storage evaluation because Walmart already has its own fire flow storage. By doing so, AVR is over-estimating the zone’s storage needs. Using AWWA’s recommended standards, ORA calculated the storage requirements in the Stoddard Zone as:

<table>
<thead>
<tr>
<th>Storage Type</th>
<th>Requirement</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operation Storage</td>
<td>0.25*MDD</td>
<td>36,034</td>
</tr>
<tr>
<td>Emergency Storage</td>
<td>ADD</td>
<td>64,926</td>
</tr>
</tbody>
</table>

---

98 AVR’s North Apple Valley Water System Improvement Plan, p. 4-3.
99 ORA obtained 80% by dividing the fire flow storage by the total storage (0.96 divided by 1.19).
100 AVR’s North Apple Valley Water System Improvement Plan, p. 5-2, Table 5-1.
101 AVR’s Response to ORA’s DR JAU-02, Question 3, p. 3.
Although ORA does not agree with AVR’s established criteria for calculating the Operational Storage of 20% of the Emergency plus Fire flow Storage, ORA is willing to entertain the evaluation in this case to demonstrate that there is enough storage in the Stoddard Zone as shown below.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Calculation</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operation Storage</td>
<td>0.2*(ER+FF)</td>
<td>120,985</td>
</tr>
<tr>
<td>Emergency Storage</td>
<td>ADD</td>
<td>64,926</td>
</tr>
<tr>
<td>Fire Storage</td>
<td>3hr of FF</td>
<td>540,000</td>
</tr>
<tr>
<td></td>
<td></td>
<td>725,911 gal</td>
</tr>
</tbody>
</table>

Using AVR’s approach, the calculation shows the storage need is 725,911 gal (0.73 MG) and there is a 1.0 MG storage tank in the zone providing adequate storage.

On a final note regarding fire storage, AWWA provided the following excerpts:

“According to the 10 State Standards, a community is not obligated to provide fire protection. AWWA M31, Distribution System Requirements for fire Protection, also states that there is no legal requirement that a governing body must size its water distribution system to provide fire protection.”

As AWWA clearly stated above, AVR is not obligated to size its water distribution system to provide fire protection, not to mention constructing additional storage to meet fire flow requirement due to the Walmart Distribution Center, which has its own fire storage. Based on ORA’s evaluation, there is an existing 1.0 MG tank, which provides adequate storage for the Stoddard Zone.

---

102 AWWA’s Determining Distribution Storage Needs, p. 9.
b) Current Seismic Standards

AVR also claims that the existing 1.0 MG tank does not meet current seismic standards set forth in AWWA’s D100-11 as another reason to construct a new tank. AWWA’s D100-11 recommends that all new steel storage tanks are constructed to provide adequate freeboard and equipped with seismic anchoring, flexible connections, and automatic shut-off valves. AVR claims that the existing Stoddard tank, which was constructed in 1988, does not have these features and should be replaced. ORA points out that the seismic standards for steel tanks contained in AWWA’s D100-11 are recommended for new tank construction and do not apply to existing tanks. In upgrading existing tanks for seismic safety, Class A water utilities have chosen to upgrade by adding flexible connections and shut off valves instead of replacing an existing tank that does not have these features.

According to the Improvement Plan, AVR currently operates the Stoddard tank with an operational freeboard of 3 feet. Based upon the size and dimensions of the existing tank, a freeboard of 5.4 feet is recommended to meet current seismic standards. Increasing the freeboard measurement by another 2.4 feet would reduce the effective volume of the existing tank to 0.77 MG.\textsuperscript{103}

The Improvement Plan fails to consider the less costly option of retrofitting the existing Stoddard tank to current seismic standards. As ORA has shown above, the storage needs in the Stoddard Zone is approximately 0.64 MG, which is lower than the effective volume (0.77 MG) of the existing Stoddard tank with the AWWA recommended freeboard distance. ORA notes that even when using AVR’s approach of estimating the storage needs, the 0.73 MG also meets the freeboard requirement of 0.77 MG.

c) Water Quality

AVR claims the Stoddard tank lacks a water mixing system. One of the
most common water quality problems is caused by how long water stays in a storage tank. When water remains in a tank for an extended period of time, it increases the potential for bacteria to grow, requiring larger amounts of chemicals to treat, resulting in an elevated formation of disinfection by products. To minimize the occurrence of such water quality issues, most water utilities reduce the amount of time that water stays in a storage tank or add a mixing system. Currently water stored in the Stoddard tank does not exhibit a water quality problem even though there is no mixing system.\textsuperscript{104} CDPH’s findings in its most recent inspection of AVR’s system confirm that there is no water quality issue in the system. AVR’s Improvement Plan concluded that if the amount of storage is increased, there is a potential for water quality issues to occur.\textsuperscript{105} The implication that increasing the tank size will result in water quality problems seems to indicate too much water will be stored and not used, causing water quality problems to develop. Based on the above, ORA asserts that there are no water quality issues with AVR’s existing Stoddard tank at this time and AVR’s request is based upon speculation and premature. Moreover, AVR’s own Improvement Plan indicates that increasing the size of the tank increases the potential for water quality problems to develop, which supports ORA’s position that an additional storage tank is not necessary at this time.

d) Conclusions

In this request, AVR overstated its needs for storage in the Stoddard Zone by including Walmart’s fire storage needs. AVR discounted the amount of available storage capacity of the existing Stoddard storage tank by applying current seismic standards, which are not required for existing tanks. ORA has

\textsuperscript{102} AVR’s North Apple Valley Water System Improvement Plan, p. 6-9, Section 6.2.1.

\textsuperscript{103} AVR’s North Apple Valley Water System Improvement Plan, p. 5-5, Section 5.2.2.3.2.

\textsuperscript{104} AVR’s North Apple Valley Water System Improvement Plan, p. 5-5, Section 5.2.2.3.2.
shown above that the existing storage tank provides adequate storage for the
Stoddard Zone. ORA’s evaluation of the storage needs has taken into account the
fact that Walmart has its own fire flow storage and is more appropriate and
reflective of operating conditions in the Stoddard Zone. Therefore, ORA
recommends that the Commission deny AVR’s request of $2.35 million to
construct an additional 1.5 MG storage tank in the Stoddard Zone.

5) New Office Building

AVR requests $2.0 million in 2015 and $1.9 million in 2016 for a total of
$3.9 million to construct a new office building. In its last application (A.11-01-001), AVR made a request to expand its office building at a cost of $702,026. On
June 29, 2012, AVR asked the ALJ to set aside its request in A.11-01-001 because
the company was looking at constructing a new office building. Subsequently, the
Commission authorized a balancing account to track the costs to expand the
existing office in D.12-09-004. Following a seismic evaluation of the existing
structure, Brown and Caldwell (“B&C”), the consultant AVR hired to evaluate its
existing building, recommended that AVR construct a new office building instead
of adding on to the existing structure.

According to B&C, the existing structure does not meet current seismic
code and will need extensive work to bring it up to code before the building can be
expanded as originally planned. AVR claims that it is “more cost effective” to
construct a new building to meet AVR’s office building needs. Therefore, AVR
proposes to construct a cost effective, energy efficient, functional building that
will serve the customers and company’s needs.

Currently, AVR houses 41 employees in three buildings and a trailer on a
5-acre site located in a mixed residential and industrial area of Apple Valley. In
D.12-09-004, the Commission found that AVR needs additional office space for

---

AVR’s Revenue Requirement Report, p. 95.
its staff and ORA will not revisit those needs here. However, AVR’s current estimated cost to address its space needs has exceeded its last request by over 550% - more than five times.\footnote{ORA Divided $3.9 mil by $702,000.} Prior to embarking on a project of this magnitude and the significant rate impacts, it is imperative for AVR to evaluate all the options that are available. In its project justification, AVR stated that B&C recommended that constructing a new building is the “most cost effective” option following its engineering study of the existing building. It should be noted that B&C’s study was focused on the structural integrity of the existing structure and the feasibility of constructing a new office building on-site. Naturally, the scenarios considered were limited to the cost between retrofitting the existing structure to enable an expansion and constructing a new building.

Subsequently, AVR hired an architectural/planning/engineering firm to develop a plan for the new building, which was submitted as part of the Needs Assessment Report. In evaluating its options for obtaining more office space, AVR also indicated it has looked into leasing office space. According to AVR, it enlisted the assistance of a real estate agent to locate a suitable property for lease, but was not successful. A copy of the letter from the real estate agent indicates that AVR wanted a property with the following requirements:

- Located within the town of Apple Valley;
- Zone industrial;
- Adequate office space > 13,000 sf;
- Adequate space for storage of construction equipment and construction material (at least 5 acres); and
- Convenient access for customers

ORA is not surprised that a property with such features is difficult, if not impossible, to find in a developed town like Apple Valley. The issue here is AVR is looking for a property that has a 13,000 square foot building and five acres of
land. The vacant land surrounding the building is over 17 times the size of the
building. In addition, although AVR is requiring 5 acres for storage equipment
because that is the size of land that AVR has in its current location, ORA noticed
during the district field visit that AVR does not fully utilize this space. At least
30% of the outside space is not used as shown in the pictures below. The first
figure is an aerial photograph of AVR’s current office. The second picture
provides a view of the parking/storage space of the current facility.
ORA asserts that if AVR was not seeking such an excessive amount of storage space, it could find plenty of office spaces available for lease. In fact, ORA was able to locate at least three properties with over 13,000 sf for lease in Apple Valley.  

In addition, AVR stated that it has also evaluated “splitting the office” in its Lease Option, but decided against it when the company considered “lost efficiencies, ongoing operating costs, and highest and best used of the owned land accessory facilities.” Although AVR did not perform a study about “splitting the office,” AVR provided the following explanation:

---

108 ORA’s search shows the following properties: 20226 Highway 18; 20220 Highway 18; 20288 Highway 18 (Major E and Major F); and Yucca Loma Road – Fountain @ Quail Ridge Phase II Building 1.

109 AVR’s Campus Needs Assessment, Executive Summary & Basis for Report, Lease Option Evaluation.

110 AVR’s Response to ORA Data Request JAU-004, Q.4, p. 3.
AVR believes that it is more efficient to have all employees working under one roof with the various departments close to the other departments that they collaborate with. Face to face communication is encouraged by AVR management for collaboration, debate, and developing ideas and solutions to issues. AVR’s desire to promote an interactive environment to promote collaboration and interdepartmental communications could not be achieved if its various departments (Customer Service, Conservation, Meter Reading, Dispatch, Accounting, Production, Engineering, Human Resources, and General Manager) were not located at the same facility. AVR believes that having employees working from separate locations would result in a loss of efficiency and synergy.

Of importance, AVR neglected to consider the option of leasing office space for its employee while retaining the current property as a storage yard. This is common practice for many Class A water utilities. For example, Suburban Water System’s employees are located in a leased office space in a strip mall and Suburban stores its equipment and vehicles in a secured storage/field yard; some CalWater district offices even store their equipment and vehicles at their well sites.

The construction cost of $3.9 million would result in a revenue requirement of $819,000 per year or $68,000 per month. Suburban Water System recently moved into a new 14,000 sf office in Covina at a cost of $15,000 per month. Suburban is able to lease an office building of comparable space to AVR’s at 22% of the cost in the City of Covina, which is located in Los Angeles County. It is a commonly known fact that real estate costs in Los Angeles County are higher when compared to that of San Bernardino County. Therefore, ORA is confident that AVR can lease a property in Apple Valley for a comparable cost to Suburban’s lease office.

Although ORA recognizes AVR’s desire to provide adequate space and a safe environment for its employees, the Commission must be ensured that constructing a new office building represents the best option at a reasonable cost. As the applicant, AVR has the burden of proof that its request is just and reasonable. In this request, AVR has not fully explored all the options for gaining
additional office space and has not performed a cost benefit analysis to
demonstrate that constructing a new office building is the most economically
feasible alternative. Therefore, ORA recommends that the Commission deny this
request and that AVR consider other viable options for gaining additional office
space and perform a cost benefit analysis prior to proceeding with this project.
AVR has the option of filing a separate application once it has the necessary data
to meets its burden of proof.

6) Mains Replacement Program

In this application, AVR seeks a budget of approximately $4.9 to $6.0
million each year to replace pipelines as shown in the table below. AVR’s budget
for pipeline replacement cost comprises 43% to 63% of AVR’s capital budget in
each year.

<table>
<thead>
<tr>
<th></th>
<th>2014 Proposed Budget</th>
<th>2015 Proposed Budget</th>
<th>2016 Proposed Budget</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mains Replacement Cost</td>

<td>63%</td>
<td>43%</td>
<td>43%</td>
</tr>
</tbody>
</table>

This is a significant investment considering AVR’s average recorded main
construction cost in the most recent 5 year is approximately $1.24 million. AVR
is increasing its main replacement program by four to five time its historical
expenditures. AVR used KANEW\textsuperscript{112} to analyze a pipeline’s lifecycle and the

\textsuperscript{111} See Attachment A – Copy of Suburban’s Lease Agreement at the end of this chapter.

\textsuperscript{112} KANEW is a modeling software developed by the AAWA Research Foundation to forecast
how much pipe to replace and what families of pipe to replace in a water system.
results of a hydraulic model to prioritize its main replacement. KANEW provides an estimate of the amount of pipelines and which pipe materials to target for replacement based on a system’s pipeline characteristics such as pipe material, age, and leak history. Like all models, the resulting output (model recommendation) is based on the input. In this case, based upon AVR’s objective of having a leak rate of 0.15 leaks per mile per year, KANEW yielded a replacement rate of 16 miles per year for Steel mains with a total replacement rate of 24 miles per year.\textsuperscript{113}

AVR has approximately 465 miles of pipelines in its system with the following characteristics:

<table>
<thead>
<tr>
<th>Pipe Material</th>
<th>System Length (mi)</th>
<th>Leak/mi/year</th>
<th>Average Age (2013)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asbestos Cement</td>
<td>55.25</td>
<td>0.13</td>
<td>28</td>
</tr>
<tr>
<td>Ductile Iron</td>
<td>32.78</td>
<td>0.04</td>
<td>8</td>
</tr>
<tr>
<td>Plastic 2 (&lt;2 leaks)</td>
<td>211</td>
<td>0.19</td>
<td>18</td>
</tr>
<tr>
<td>Plastic 3 (&lt;3 leaks)</td>
<td>4.43</td>
<td>4.14</td>
<td>25</td>
</tr>
<tr>
<td>Steel 5 (&lt;5 leaks)</td>
<td>108</td>
<td>1.90</td>
<td>48</td>
</tr>
<tr>
<td>Steel 6 (&lt;6 leaks)</td>
<td>20</td>
<td>25.28</td>
<td>54</td>
</tr>
<tr>
<td><strong>Total\textsuperscript{115}</strong></td>
<td><strong>465</strong></td>
<td><strong>1.41</strong></td>
<td><strong>27</strong></td>
</tr>
</tbody>
</table>

AVR’s proposed main replacement program targets steel and plastic mains because these mains have a higher leak rate. As shown above, AVR’s system has an average leak rate of 1.41 leaks per mile per year and the company seeks a main replacement program to reduce this rate to 0.15, which is an 89% reduction. Such an aggressive and unpractical objective would require an astronomical increase in capital investment.

\textsuperscript{113} AVR’s Asset Management Study for Water Mains, p. 8.
\textsuperscript{114} AVR’s Asset Management Study for Water Mains, p. 4.
\textsuperscript{115} The total system length does not add up to 465 miles.
AVR’s aim of reducing its leak rate by 89% coupled with using a shorter service life for plastic and steel pipelines and an over estimation of leak rate for these two pipe materials resulted in KANEW calling for a higher replacement rate for these two categories of pipelines.

**a) Service Life for Plastic and Steel Pipelines**

In forecasting the life cycle of pipelines, KANEW takes into consideration the service lives of pipelines based on different materials. Because there are many factors that can affect a pipe’s service life such as materials and soil conditions, AWWA provided a list of pipe service lives based on material and location (soil conditions) as shown below.

<table>

</tbody>
</table>

In its analyses, it appears that AVR used the numbers provided for the Southern part of the US although AVR’s water system is located in what would be considered the Western US. It should be noted that the service lives for steel and PVC pipes in the South are 25 years and 15 years shorter than in the West. The KANEW analysis was performed with the lower pipe service lives and has the potential to result in a premature recommendation of pipelines replacement.

**b) Leak Rate**

A significant effort in running an analysis such as KANEW is to populate or input all the system’s pipe information into the model. The results of the
analysis are dependent on the information entered into the model. In its inventory of leak information, AVR has approximately 1,060 leaks that were not associated with any pipelines. AVR assumed that 92% of these leaks were from steel pipes and arbitrarily assigned them to this category of pipes, thereby increasing the number of leaks attributed to steel pipes by 28%. AVR also assumed the remaining 8% (81 leaks) of unidentified leaks were from plastic pipes, which increased the number of leaks for plastic pipes by 17%.

ORA points out that performing the analysis with lower estimated service lives for steel and plastic pipes while increasing the numbers of known leaks associated with these pipe materials certainly affects the outcome of the analysis. Specifically, it artificially inflates the risk of failure associated with these two categories of pipes thereby resulting in a higher rate of replacement than needed.

---

**Chart 8-F**

*Total Number of Main Leaks per Year*¹¹⁶

---

¹¹⁶ AVR’s Revenue Requirements Report, p. 63.
Since 1994, AVR has replaced over 95 miles of mains at a rate of approximately 4.8 miles per year.\textsuperscript{117} The major pipe material replaced/abandoned during the last 20 years has been steel with a small amount of plastic.\textsuperscript{118} As seen above, AVR has managed to substantially reduced its water leaks from 3198 in 1995 to 511 leaks in 2012.\textsuperscript{119} AVR credited its success in reducing the number of leaks in recent years to its main replacement program and, therefore, plans to increase its main replacement program.\textsuperscript{120} While ORA agrees with AVR’s assessment, ORA asserts that it is not necessary for AVR to accelerate its main replacement. AVR proposes to replace 5.17 to 6.6 miles of pipelines per year between 2014 and 2016. This is equivalent to a replacement rate of 1.11% to 1.41%. The national average pipe replacement rate for water utilities is approximately 0.5%.\textsuperscript{121} Considering the young age of AVR’s system with a 27 years weighted average age of its pipelines, one would expect AVR to replace pipelines at a much lower rate than that the national average. AVR has what is considered to be a relatively young water system, when compared to the average age the oldest steel mains at 70 years old.\textsuperscript{122} According to the US EPA, there are still many mains in the US, which were installed in the 1800’s and continue to “provide adequate and reliable service.”\textsuperscript{123} In addition, AVR’s system water loss is 7%,\textsuperscript{124} which is much lower when compared to the national average of 10%.\textsuperscript{125}

\textsuperscript{124} AVR’s Response to the Minimum Data Requirements, E-2.
As a matter of fact, a fact sheet produced by the National Drinking Water Clearinghouse at West Virginia University stated that a system loss of 10 to 20% is normal.\textsuperscript{126} Furthermore, the weather and soil conditions in the West Coast, especially Southern California, are considered to provide a more ideal environment for pipelines when compared to those of the East Coast, which has more extreme weather and typically more acidic and wetter soil conditions. Therefore, pipelines in the East Coast do not last as long as they do in the West Coast. AVR’s pipelines are relatively young when compared to the national average and its water loss rate is below the national average. Yet AVR, which has a younger system and is located in a geographical area considered to have more ideal weather and soil conditions, is proposing a replacement rate 2.8 times that of the national average. The data analyzed by ORA simply does not support AVR’s request for such an aggressive pipeline replacement program and ORA thus recommends that the Commission deny this request.

c) Hydraulic Model

The results of the KANEW analyses indicated that steel mains have a higher probability of leaking and need to be replaced. AVR then used a hydraulic model to prioritize mains replacement. The results of the hydraulic model indicate a need to improve transmission capacity by replacing and increasing the size of its existing mains. Over 90% of the number of mains that AVR proposed is for the purpose of upsizing steel mains. AVR stated that these projects will allow the system to minimize pumping costs, meet peak demand, and provide adequate fire flow capacity.\textsuperscript{127} According to AVR, customer demand has been increasing over

\textit{(continued from previous page)}

\textsuperscript{125} National average - US EPA’s Distribution System Inventory, Integrity, and Water Quality, January 2007, Table 2, Statistics of US Distribution Systems.

\textsuperscript{126} National Drinking Water Clearing House’s Technical Brief, Leak Detection and Water Loss Control, p. 1.

\textsuperscript{127} AVR’s Revenue Requirements Report, p. 66.
the years necessitating the company to increase the transmission capacity to
transfer more water from the southwestern portion of the system to the north and
east where customer growth is located.\textsuperscript{128} The following excerpt from AVR’s
Water Transmission Main Study provides an explanation of the issues:

“All of AVR’s potable water supply is from wells that are primarily
located along the western edge of the distribution system. The
majority of the well supply is located in the southwestern portion of
its service area. One of the major issues that AVR is experiencing is
the inability to operate a large number of wells without experiencing
excessive pressure increases. These \textit{pressure increases are}
undesirable in that they can \textit{cause} things such as \textit{increased leak}
rates and require more pumping energy to be used. Because AVR
\textit{needs to be able to pump all of its wells to recover from high}
demands and because \textit{any new wells} will make this issue even more
pronounced, additional transmission capacity is essential.”

[Emphasis added]

According to AVR, recent increases in demand require the company to
pump and transfer more water, which would increase the pressure in the
transmission mains and subsequently causes more leaks. ORA, however, finds
this claim to be unfounded. First of all, based upon recorded production data,
customer demand has not increased in recent years. As shown in the chart below,
customer demand in recent years has decreased by over 30\% from its high in
2007. As a result of lower customer demand, AVR should be pumping and
transferring less water, not more as the company claims.

\textsuperscript{128} AVR’s Revenue Requirements Report, p. 66.
Secondly, if AVR is transferring more water to meet demand causing an increase in pressure levels in the mains which would result in an increased leak rate, then we would see the number of leaks increasing in recent years. However, the chart below shows a decreasing trend for the number of leaks in AVR’s system.

129 AVR’s Analysis of Source and Storage Capacity Technical Report, Table 1.
The data shown above does not validate AVR’s claim that a recent increase in customer demand results in the need to replace transmission mains in its water system. Although current customer demand does not require an aggressive main replacement, adding new wells to provide for additional customer demand due to growth may require main replacement. If AVR needs to construct wells to facilitate customer growth in the north and east part of the system, the Commission’s Rule 15 Line Main Extensions explicitly requires that the parties benefiting from the project bear the construction cost. Existing ratepayers should not be paying for its construction. AVR needs to factor in the cost of upgrading the mains along with the costs to construct new facilities to support growth in its water system.

---

d) Historical Expenditures

As shown in the Table 8-E below, AVR’s most recent five year expenditures in main replacements range between $239,121 to $3.2 million with an annual average of $1.65 million. In 2012, AVR spent 12 times what the company spent in 2009 on main replacement. In other words, AVR increased its main replacement costs by 1,200% in four years. During the same interval of time, the leak rate was reduced by 21%. Although it is difficult to identify a direct correlation between the cost to replace pipeline and the reduction in the number of leaks, there should be a reasonable and affordable rate of replacement. Therefore, ORA recommends a main replacement budget that reflects the average annual expenditures of the last five years.

e) Conclusion

Ratepayers have been conserving water at an unprecedented rate. Customers have been using 30% less water in the AVR water system. However, ratepayers will not realize the benefits of their conservation efforts if AVR continues to increase fixed costs by implementing programs to accelerate replacement of assets at a rate that is not necessary. ORA has shown that conditions of AVR’s pipeline system such as age, water loss rate, and a decreasing

---

111 Recorded Expenditures data come from AVR’s Response to ORA Data Request, JAU-005.
leak rate do not warrant a replacement rate that is above the national average. Therefore, ORA recommends that the Commission deny AVR’s request and adopt ORA’s recommendations for AVR’s pipeline replacement program.

7) Vehicle 08-6

AVR requests $37,016 to replace Vehicle #08-6 in 2015. Vehicle #08-6 was purchased in 2008 and is projected to have 118,832 miles at the end of 2016. The appropriate time to replace this vehicle is in 2017 per the Department of General Services recommendation of replacing a vehicle when it reaches 120,000 miles. ORA recommend that the Commission deny AVR’s request for the replacement cost of this vehicle in 2015.

GENERAL OFFICE PLANT IN SERVICE

Park requested several additional plant items identified in Chapter V of AVR’s General Office Report. Park estimated $1.735 million in 2014, $363,716 in 2015, and $367,906 in 2016 for these requested General Office (“GO”) plant items. ORA’s estimates for the GO plant items total $325,050, $286,716, and $345,906 for years 2014, 2015, and 2016, as shown in the tables below. Differences between ORA and Park’s estimates are due to ORA’s recommended reductions in the capital additions for years 2014 through 2016, discussed below.

</tbody>
</table>
In this application, Park requests authorization to purchase approximately $1.729 million on software and modules for the General Office. Aside from Power Plan, Park also requests authorization to purchase approximately 14 modules to add to its existing JD Edwards and CIS systems at an approximate cost of $328,960. ORA’s discussion below specifies why ORA disagrees with Park’s request for some of the GO plant items.

8) CIS/JDE Enhancement

a) Import Tool

In 2014, Park requests $10,000 (100 hours at $100/hour) to develop a capability to import customer information from other water companies to Park’s system. Park explained that this capacity is needed to migrate new customer data into its system when Park purchases a new water system. It is apparent that current customers do not benefit from this capital investment because this import tool is for new customers. In addition, AVR’s request deviates from the
Commission standard ratemaking practices where utilities are not allowed to earn a rate of return on plant, which is not in operation and providing service to ratepayers. Under the Commission’s “used and useful” principle, “ratepayers are required to bear only the reasonable costs of those projects which provide direct and ongoing benefits, or are used and useful in providing adequate and reasonable service, to the ratepayers”. Therefore, current ratepayers should not pay for this capital investment and clearly, this request should be denied.

b) JDE – RSS, Sourcing, Core Tools, and One View Reporting

In 2015, Park requests $77,000 to purchase some add-on modules to its existing system to centralize employees’ product purchasing. Park has an existing purchasing module, but “the company does not centralize purchasing, control vendor selection, and implement procurement standards”. According to Park, these add-on modules will allow the company to accomplish these tasks. It is important to note that Park currently has a purchasing module but its product purchasing practice is not centralized because its employees are not consistently using the module to purchase products. However, Park is requesting to add on more modules to the existing purchasing module. Based on Park’s experience with the existing purchasing module whereby its employees are not using it consistently, ORA is doubtful that Park will be able to centralize its purchasing through these additional modules. If employees are not restricted to make purchases through the existing modules, the additional modules are not beneficial.

9) Power Plan

In 2014, Park requests $1.4 million for the purchase of a financial forecasting software known as “Power Plan.” Currently, Park uses a host of

---

134 Park’s GO Report, p. 31.
135 Park employees disclosed information during fieldtrip on February 27, 2014.
spreadsheets and databases along with JD Edwards systems and Customer Information System (CIS). The systems and spreadsheets used to prepare budgets, forecasts, and projections are “not well integrated and linked”\textsuperscript{136} Also, the company’s income tax returns are prepared by an outside accounting firm, Ernst & Young.\textsuperscript{137} According to Park, Power Plan is needed to: (1) Help the company meet the requirements of the new Tangible Property Regulations and Tax Repair Regulations; (2) budget, forecast, and track its financials; (3) manage projects; and (4) produce financial and management reports.\textsuperscript{138} Park intends to replace its current access databases and excel spreadsheets with Power Plan.

Park considered several asset and financial management options such as modifying its current system, constructing a new system, and purchasing another software. Park stated that most systems on the market do not offer a solution that the company seeks and it takes too much time to build a new system.\textsuperscript{139} Park also looked at available software from three companies - Prophix, KCI, and Adaptive Planning - but decided to purchase Power Plan.\textsuperscript{140} Park believes that Power Plan will allow it to automate many of the functions that its employees are currently performing thereby reducing employee costs and outside services expense by approximately $203,800 per year.\textsuperscript{141}

Park also pointed to the fact that several other water utilities such as CalWater, Cal Am, and Golden State are using Power Plan to manage their assets.\textsuperscript{142} Since these companies and some major electric utilities use Power Plan, Park asserts that it should purchase it too.

\textsuperscript{136} Park’s GO Report, p. 22.\textsuperscript{137} Park’s GO Report, p. 11.\textsuperscript{138} AVR’s Response to ORA’s Data Request JAU-003, Q. 1.\textsuperscript{139} AVR’s Response to ORA’s Data Request JAU-003, Q. 4.\textsuperscript{140} AVR’s Response to ORA’s Data Request JAU-003, Q. 4.\textsuperscript{141} AVR’s Response to ORA’s Data Request MUK-001, Q. 2c.\textsuperscript{142} Park’s GO Report, p. 20.
ORA disagrees with Park’s alleged need for Power Plan and asserts that Park’s $1.4 million request should be denied. First, there are major differences in the economy of scale between Park and CalAm, Cal Water, and Golden State. The customer base for those water companies that use Power Plan is much larger than Park’s customer base. The numbers of customers in California served by these large water companies range between 187,000 and 508,000.\textsuperscript{143} In addition, Cal Am’s parent company American Water Works has over 5.3 million customers while Cal Water has approximately 760,000 customers in the US.\textsuperscript{144} Park, on the other hand, has approximately 69,000 customers in California.\textsuperscript{145} While Power Plan may be necessary for water companies with a large customer base, it is unnecessary for a water company with a smaller customer base such as Park. In fact, water companies of comparable size to Park such as Suburban Water Systems and San Gabriel Water Company use SAP and AS400 systems for asset managements.\textsuperscript{146}

Second, Park stated that one of the reasons it needs Power Plan is to meet the new federal Tangible Property Regulations and the Tax Repair Regulations. However, Park has been using an outside accounting firm to prepare its tax return. Park provided the following information:

\begin{itemize}
\item Information came from Cal Water, CalAm, and Golden State’s 2012 Annual Report, Schedule D-4.
\item http://www.amwater.com/CCR/sanmarino.pdf, p. 2 provided the population served as 14 million and https://www.calwater.com/about/corporate-information/ provided the population served as 2 million. ORA divided these numbers by the number of people per household (2.61) from the US Census website - http://quickfacts.census.g/qfd/states/00000.html
\item Park’s GO Report, p. 4, Table 1-M.
\item ORA’s discussions with San Gabriel Water Company (Dan Dell’Osa) and Suburban Water Company (Robert Kelly), April 1, 2014.
\end{itemize}
“Power Plan software will support the Company’s efforts to bring in-house certain activities associated with preparing the Company’s income tax return. Professional services forecasted for 2015 have factored in reduced cost in preparing the income tax returns.”  

ORA, however, was not able to locate the reduced cost that Park cited in its testimony. Park estimated $126,260 for 2014, $130,048 for 2015, and $135,115 for 2016 as Audit and Income Tax Expenses. Park’s recorded expense for this item ranges between $120,082 and $133,364, in 2011 to 2013. Based on these amounts, any savings cited here are truly insignificant. Moreover, Park will get most of the tax benefit from the new Tax Repair regulations, because it will be able to re-state its back taxes and will be able to get significant refunds, which are Federal Income Taxes that ratepayers funded through rates in the past. The only benefit to ratepayers will be a reduction in rate base due to the increase deferred income due to the accounting change. Therefore, if Park decides to move forward with the software it should cover the cost with the benefit it will receive from making the accounting change.

Third, Park indicated that the company considered software offered by three other companies, but rejected them because they did not meet its needs. ORA, however, found that Oracle has a JD Edwards EnterpriseOne suite that has many of the same features as Power Plan such as financial management, project management, asset lifecycle management, order management, manufacturing management, and reporting. In addition, the costs for these modules are far less than the $1.4 million requested for PowerPlan.

---

147 Park’s GO Report, p. 21.
148 GO Expense 2015rr Worksheet, ExpenseDetail Tab, Line 128.
149 GO Expense 2015rr Worksheet, ExpenseDetail Tab, Line 128.
Finally, Park stated that the amount of time saved from Power Plan’s automated tasks will allow the company to reduce its work force by one employee in the engineering department. Park forecasted a saving of $203,800 per year in employee costs while the purchase of Power Plan requires a revenue requirement of $314,234.\(^{151}\) Park neglected to mention that Power Plan also has a maintenance expense of $76,234 per year.\(^{152}\) This will bring the total revenue impact to over $186,000 annually that Park customers would have to pay for Power Plan.

Although ORA agrees with Park’s assumption that the revenue requirement will decrease overtime due to depreciation, ORA is compelled to point out that software tends to have very short life cycle. It is likely that the software will require expensive upgrades and additional modules before it is fully depreciated. Therefore, ORA recommends that the Commission disallow Park’s request to purchase Power Plan.

**10) Park’s Office Renovation**

AVR requests $1.51 million in 2014 and $1.77 million in 2015 to renovate the current office building located in the City of Downey. (This renovation project is part of Park Water Company’s Plant addition. It is not part of General Office addition but flows to GO ratebase calculation.) The Downey building is 14,577 square feet (sf) and houses employees of Park Water Company and the General Office.\(^{153}\) The building was constructed in 1969 and is made up of a reinforced brick single story structure connected to a concrete tilt-up warehouse. In 1994, Park added a second floor to the tilt-up warehouse and reconfigured the customer lobby. A seismic upgrade was performed in 1999.\(^{154}\) In recent years, Park had several other office reconfigurations to accommodate growth in its customer

\(^{151}\) AVR’s Response to ORA’s Data Request MUK-001, Q. 2c.

\(^{152}\) Park’s GO Report, p. 10.

\(^{153}\) Kennard Design Group Report, p. 11.

\(^{154}\) Kennard Design Group, p. 24.
service and information technology departments. Park believes that its practice of
placing new employees where space was available has created a less than ideal
working environment. According to Park:

“This has really created a dysfunctional work space where
supervisors are unable to monitor their personnel and the
lack of collaboration with their fellow staff can affect staff
morale and productivity. Park has found a need to get its
entire staff under one roof, into their various work groups,
and close to the other work groups that they collaborate
with.”155

In other words, Park wants to “locate its staff in the same floor by
department”.156 Therefore, Park hired an architectural firm (Kennard Design
Group) to evaluate the existing space and recommend a course of action for
renovating the office.

Based on Park’s goals of creating an open concept for its office space and
having employees in the same group sit together, Kennard recommended a
renovation project with an estimated cost of $3.28 million. Kennard’s plan called
for taking down some walls to create space for cubicles, reducing the size of some
existing offices, adding approximately 225 sf to the lobby area, and adding 375 sf
to the warehouse to allow the installation of an elevator. Kennard also
recommended that Park upgrade the electrical, mechanical, and plumbing systems
and make additional upgrades to meet the current American Disability Act (ADA),
Title 24 Energy Requirements, and fire/building codes.

Hence, Park’s simple goal of grouping its employees with their fellow staff
has spiraled into a multi-million dollar major renovation project that costs almost
as much as construction of a new AVR office building. Although ORA recognizes
that Park’s office building is larger than the proposed AVR office building, the
estimated cost of a renovation project is at best a rough estimate. It is difficult to

---

estimate the costs of the necessary upgrades when the plumbing, mechanical, and electrical systems and seismic conditions are hidden behind walls. Park’s cost estimates for these upgrades came from its architectural firm and not the contractor will be doing the actual work, hence, they are preliminary. It will be even more difficult to control costs once the walls are torn down and there is no incentive for a regulated utility to control costs as ratepayers are paying for these projects. Therefore, the cost of this project has the potential to increase from the estimated cost of $3.28 million.

Park’s explanation that there is a lack of collaboration among its employees because they don’t sit together seems a little far-fetched. Today’s technological advances such as emails, cell phones, and video-conferences allow people in different countries to collaborate on projects. ORA finds it difficult to perceive that Park’s employees are less collaborative even though they are not next to each other but are located in the same building. Two people in different parts of the building have the capability of communicating and looking at the same document on their computer screens. It is no longer necessary to have a face-to-face meeting. Park’s employees are highly trained professionals in their field who should be able to work independently. Not sitting together would not hinder their professionalism, morality, or productivity. Moreover, Park is requesting software and modules as discussed above to automate many of the functions that are currently performed by different staff. Managers would have reports on their “dashboards”, employees can do all the paperwork in the field with the CIS Infinity module, employees can purchase products on their own computers, and software to track employees’ presence. These modules and software would allow Park’s employees to work independently and seem to discourage communications among staff. Park’s office revamping project and its requests for software modules seem to counteract the face-to-face interactions that Park is seeking by having

---

1 Information provided during fieldtrip on February 27, 2014.
groups sit together. Therefore, it is not necessary for Park to renovate its office so
employees from the same group can sit together to forge a collaborative
atmosphere among its employees and recommend that the Commission disallow
this request.

Although Park disclosed that it has considered such options as renting
office space, constructing a new building, and remodeling the existing building,
Park did not consider several other potentially less costly options to reorganize
office space as ORA discusses below. Even if Park wants to reshuffle its
employees so they can sit together, the company could have done so without the
need to revamp its entire office layout. Kennard recommended a major renovation
because Park wants to renovate the office. Park even has the space for a work-
out/exercise room for its employees and therefore certainly has the space to move
things around. Also, the cost of constructing a new office building would double
the cost of renovating the existing office and is not a cost effective solution.

Although ORA understands Park’s desire to bring a building that was constructed
44 years ago up to modern standards to provide a comfortable working
environment for its employees, Park must realize that ratepayers are required to
pay for these costs through water rates. Therefore, Park must evaluate all the
options that are available and propose the most cost effective solution. In this
case, Park failed to do so by not evaluating leasing an office building for the
employees that should be in the office while keeping the current space as a field or
storage location. Park rejected the leasing option because it does not want to
locate employees in different offices. However, Park should have considered
leasing an office that would house all its employees under one roof. Park also did
not want to rent space because “rent is a recurring expense that will continue
forever”. Park’s renovation costs has a revenue requirements in excess of
$668,000 which will stay in the ratebase until fully depreciated, by which time, it

---
188 Park’s GO Report, p. 24.
is likely that Park will need a new building. Park has not performed a cost benefit
analysis to show that its request to renovate the existing office is the best option at
the lowest cost to ratepayers.

Park should also evaluate moving from its current location by purchasing
an office building in a nearby low cost area or in its service area. Downey is not
even in Park’s service. This is an opportunity for Park to consider moving closer
to its customers. Park has the burden of proof that its request is just and
reasonable. In this request, Park has not fully justified its need for remodeling the
existing office building and explored all the options available. Therefore, ORA
recommends that the Commission disallow Park’s request to renovate the office
building at a cost of $3.28 million.

B. CONCLUSION

ORA’s recommendations have been incorporated in the calculations for
ORA’s recommended Plant in Service as shown in Tables 8-A and 8-F.
Attachment A - Copy of Suburban’s Lease Agreement
CHAPTER 9: DEPRECIATION RESERVE AND DEPRECIATION EXPENSE

A. INTRODUCTION
This Chapter sets forth ORA’s analyses and recommendations regarding depreciation reserve and depreciation expense for AVR (Domestic and Irrigation) and General Office. Tables 9-1 and 9-2 included in Appendix A provide ORA’s and AVR’s estimates for depreciation reserve and depreciation expense for Test Year 2015 and Escalation Year 2016.

B. SUMMARY OF RECOMMENDATION
ORA has reviewed and agrees with the methods used by AVR to calculate depreciation reserve and depreciation expense for Test Year 2015 and Escalation Year 2016. The differences between ORA’s calculations and the numbers provided by AVR are attributable to the differences in plant estimates and ORA’s use of updated data.

C. DISCUSSION
ORA used the recorded year-end 2013 depreciation reserve balances for the beginning of year depreciation reserves 2014. AVR’s proposed depreciation rates in this application are based on a new remaining life study performed by AVR. AVR’s proposed rates were calculated in accordance with a straight-line remaining life curve using the Commission’s Standard Practice U-4. Depreciation accruals for Test Year 2015 and Escalation Year 2016 are based on the proposed depreciation rates applied to the average respective estimated annual plant balances.

The following table shows the depreciation rates for Test Year 2015 and Escalation Year 2016.

D. CONCLUSION

ORA reviewed and accepts AVR’s methodology and depreciation rate. The differences in ORA and AVR proposed depreciation reserves and accruals are due to differences in plant additions and the use of the recorded year end 2013 depreciation reserve balances.
CHAPTER 10: WORKING CASH AND RATEBASE

A. INTRODUCTION
This Chapter sets forth ORA’s analysis and recommendations for AVR’s Domestic, Irrigation and allocated General Office rate base.

B. SUMMARY OF RECOMMENDATIONS
Differences in Rate Base are mainly due to differences in AVR’s requested capital investment in plant and ORA’s recommended level of capital investment. Tables 10-1 and 10-2 (in Attachment A) provide summaries of ORA’s and AVR’s weighted average depreciated rate base (Domestic and allocated General Office) respectively. ORA’s and AVR’s weighted average Irrigation depreciated rate base are shown in Table 1-4.

C. DISCUSSION
1) Materials and Supplies
AVR’s estimated materials and supplies (“M&S”) for Test Year 2015 is based on a percentage of the average number of customers in the Test Year. This percentage is based on a 5-year average calculated from the relationship between M&S recorded amounts and average numbers of customers per year (2008 – 2012). ORA agrees with this methodology and estimates.

2) Deferred Income Taxes
The difference in Deferred Taxes is attributable to differences in plant estimates.

3) Interest Expense
The difference in Interest Expense is also attributable to differences in plant estimates. Both AVR and ORA use 3.49% weighted cost of debt to determine the interest expense.

4) Working Cash
Working Cash is a component of Rate Base on which a utility is allowed to earn its authorized rate of return. The calculation of working cash is an iterative calculation that will change depending upon estimated revenue requirements, which in turn will be influenced by working cash needs. Working cash is the additional amount of capital that is required to fund ongoing operations and bridge the gap between the time expenditures are made and the time revenues are received. Working cash can be positive or negative and consists of several different components. In the current proceeding, both AVR and ORA derive a working cash allowance using the Detailed Basis set out in accordance with Standard Practice U-16. This method includes the forecasted Operational Cash Requirement and a Lead-Lag study of timing differences between collection of revenues and payment of cash expenses.

5) Operational Cash

AVR’s determination of operational cash requirement is derived in part from the balance sheet of AVR and in part from the balance sheet of Park’s Corporate Division General Office, a portion of which is allocated to AVR. ORA recommends adjustments to AVR’s operational cash requirement forecast based on its analysis of the balance sheet accounts.

In its operational cash estimate, AVR has included the average unamortized balance of Regulatory Commission expense based on a beginning of year 2105 balance of $486,911. This total of $486,911 is the amount of Regulatory Commission expense AVR estimates that it will incur over the three-year rate case period, 2015-2017. AVR’s requested annual revenue requirement therefore

---

159 Standard Practice U-16 is an informal document issued by the Commission’s Division of Water and Audits to provide guidance on working cash calculations but does not constitute a Commission-approved methodology because it has never been adopted by the Commission.

includes one-third of this total, or $162,304 per year.\textsuperscript{161} This expense would be
recovered through rates authorized for Test Year 2015, and Escalation Years 2016
and 2017. If the $486,911 is included in the operational cash estimate, AVR
would be further compensated for an expense that will already be recovered in
rates. Therefore, ORA removes all dollars associated with Regulatory
Commission expenses in its operational cash estimate.

AVR also included as part of its operational cash estimate the average
unamortized balance of various study costs. These costs include ARC Flash
Hazard Assessment ($20,000), Vulnerability/Mitigation Study ($20,000), Water
Supply Evaluation ($7,000), and Leadership feedback ($12,000) for a total of
$59,000.\textsuperscript{162} As described in Chapter 3, ORA is disallowing these expenses. ORA
removes these costs from the estimate of operational cash.

The balance sheet for Park’s General Office includes the cost of a $300,000
Operational Efficiency Study. As discussed in detail in Chapter 12, Park does not
have any supporting documents for the proposed Operational Efficiency Study,
has not conducted a cost benefit analysis, and does not have approval from its
Board of Directors. Clearly, it is premature to include the proposed operational
efficiency study in the revenue requirements of this GRC. Accordingly, ORA has
removed this forecasted expense from the forecast for operational working cash.

The result of ORA’s adjustments to AVR’s forecast of operational working
cash is a reduction of $520,332 in 2015 and $308,672 in 2016.

\textsuperscript{161} ORA estimates a lower amount for Regulatory Commission expense. See ORA’s testimony of
Herbert Merida.

\textsuperscript{162} AVR Workpaper “AVR Working Cash 15r,” Deferred Debits tab and AVR Workpaper “AVR
Expenses 2015r,” ExpenseDetail” tab.

</tbody>
</table>

6) Lead-Lag Study

In its application, AVR proposed an increased revenue lag from 50.84 days to 56.34 days. AVR asserts that the current calculation assumes the revenue in the revenue requirement is fully billed and received in the same year. AVR states that “a significant portion of the revenue requirement is not billed or received in that year but is instead captured in the WRAM and billed and received much later in the form of surcharges.”

ORA is opposed to AVR’s request for an increased revenue lag. In addition to earning interest from the WRAM account, AVR is now requesting to change the revenue lag and increase its working cash. ORA points out that if the alleged revenue lag as a result of the WRAM account were substantive, its impact would be affecting other water utilities with a similar WRAM account. Thus, ORA recommends that this issue be addressed in an industry-wide proceeding such as a rulemaking (OIR).

The differences between ORA’s and AVR’s estimates result from different revenue estimates, different expense estimates, and different revenue lag days.

D. CONCLUSION

ORA has thoroughly evaluated AVR’s proposed estimates and the Commission should adopt ORA’s recommendations.

---

CHAPTER 11: CUSTOMER SERVICE

A. INTRODUCTION

This chapter sets forth ORA’s analysis and recommendations for AVR’s Customer Service systems and procedures.

B. SUMMARY OF RECOMMENDATIONS

ORA analyzed AVR’s customer service and procedures and finds that the company’s current procedures provide good quality service. Moreover, it appears that AVR plans to implement additional procedures related to customer service that will be beneficial to customers.

The standard set by General Order 103-A is that the number of customer complaints should not exceed 0.1% of the total number of customers.\(^\text{164}\) The results of ORA’s analysis of the number of complaints filed by customers (from 2009 to 2013) indicate that the overall level of customer satisfaction complies with the GO 103-A standard. Hence, it appears that AVR has been able to achieve that level of customer satisfaction by not exceeding the GO 103-A customer complaint standard. (See Table 11A.)

C. DISCUSSION

ORA sent AVR Data Request CDW-004 to find out what steps AVR has taken to provide its customers with excellent customer service. AVR responded with an outline of its customer service praxis, which includes the following:
• Assist customers with high water bills. Confirm read. Check meter for leaks.

• Schedule water audit to determine the reason for high usage. Technicians assist customers with setting irrigation timers as the temperatures rise and fall.

• Provide Data Logger historical information to customers from AMR meters. This is a time and date stamped report indicating daily usage and inconsistencies.

• Participated in Data Sharing program with Southwest Gas and Southern California Edison. Customer files are shared among these companies to determine the low income customers that are not already taking advantage of AVR’s CARW program. The low income program is now self-qualifying which enables more customer participation.

• AVR has changed its billing outsource vendor to a California company. This enables water bills to reach customers in a timelier manner through the USPS.

• AVR’s automated phone system has been enhanced to be more user-friendly and provide additional services to customers. For example, customers can make payments by phone, request a payment extension, obtain account information etc. This phone service is available 24 hours.

• A courtesy call is generated daily to customers’ phone number of record, reminding them that their water bill payment is due.

• AVR’s website is continually updated with information that is beneficial to our customers. It also enables customers to register on Infinity Link. This link allows customers to obtain account information and make a payment.

• Fillable forms for various services are available on the website. Customers no longer have to rely on faxing applications for water service or coming to the office to start new service. Forms can be e-mailed to the Customer Service Department for processing.

• Security deposits are often required to start new water service. AVR is now able to quote a deposit amount to the customer, based on the
average billing. This deposit charge will appear on the customers’ first bill.

- Cash for grass program is offered where a customer can replace grass for drought tolerant landscaping, rock scape, or artificial turf and receive a financial incentive of $0.50/sq-ft of turf.

ORA, in that same data request, asked AVR the following question:

“AAre there any additional steps that the company will be taking to continue to improve its customer service for the next rate case cycle?” AVR’s response stated as follows:  

AVR is investigating the feasibility of the activities shown below (with the exception of HomeServe which AVR has recently implemented) which are designed to enhance the services provided to customers. Some of these activities may require Commission approval prior to implementation.

- Partnership with HomeServe, a third party vendor who provides water service line insurance.

- Provide budget billing where customers pay the same amount per billing cycle for their water bills, spread over a year timeframe.

- Provide e-bills, eliminating paper bills.

- Provide GoMobile app for cell phones.

D. CONCLUSION

ORA finds AVR’s customer service level satisfactory and in compliance with the requirements of GO 103-A.

165 AVR’s Response to Question 3 of ORA’s DR CDW-004.
CHAPTER 12: GENERAL OFFICE

A. INTRODUCTION

This chapter presents Office of Ratepayer Advocates’ (“ORA”) analyses and recommendations regarding the General Office (“GO”) expenses incurred by Park Water Company (“PWC”) to be recovered from ratepayers in Apple Valley Ranchos (“AVR”) General Rate Case (“GRC”) A.14-01-002. During the review process, ORA examined the general office expenses from the GRC filing, PWC’s responses to data requests, emails, and findings from ORA audits of PWC’s general office expenses. As a result of its review, ORA calculates its own recommendation for Test Year (“TY”) 2015 for each GO expense account, which is then allocated to AVR domestic and AVR irrigation in accordance with the Four-Factor allocation method adopted by the Public Utilities Commission (“Commission”).

PWC is headquartered in Downey, California, and provides water services in two states, Montana and California. Mountain Water Company, a wholly owned subsidiary of PWC, provides water service in Montana. PWC provides water services in two places in California: (1) AVR, a wholly owned subsidiary of PWC, provides water service in and around the Town of Apple Valley in San Bernardino County, and (2) Central Basin Division, an operating unit of PWC, provides water service in Los Angeles County.

PWC’s General Office provides engineering, financial, information technology, regulatory, water quality, and other management services to its subsidiaries, AVR and Mountain Water, and to its Central Basin Division. The costs of these services are either directly assigned or allocated to each division/subsidiary.

The Commission established the Four-Factor Method in 1956 for the purpose of setting forth procedures to determine the allocation of expenses and common utility plant among departments, districts and states. D.09-03-007, p. 18.
B. SUMMARY OF RECOMMENDATION

After reviewing PWC’s application, conducting discovery, and auditing PWC’s GO expenses, ORA recommends GO expense of $7,673,875 in TY 2015 and $7,925,254 for Escalation Year 2016. PWC’s proposed GO expense is $7,958,626 for TY 2015 and $8,295,774 for Escalation Year 2016. ORA’s GO expense recommendation is lower than PWC’s request by $284,751 (3.71%) in TY 2015 and $370,520 (4.46%) in 2016. The difference between ORA’s recommendation and PWC’s forecast is due to several factors, including, but not limited to, use of different inflation factors, use of different methodologies, and ORA’s removal of various unsupported expenses. Table 12-A at the end of this chapter provides an overview of the quantitative differences between PWC’s request and ORA’s recommendation.

C. DISCUSSION

PWC has generally used a five-year (2009 - estimated 2013) average of the incurred costs adjusted for inflation to estimate its TY 2015 expenses. However, in some instances, PWC has deviated from following a five-year average method in forecasting its budget. In those instances, PWC has either used a two-year average method or a budgeted amount. PWC explains that it used a different methodology (two-year average) because the use of the historical average does not result in reasonable estimates for the test year.

PWC used the Commission’s Four-Factor method to allocate the General Office expenses to each of PWC’s divisions and subsidiaries. The four factors (or categories) that ultimately determine the Four-Factor percentages include the following: (1) operation and maintenance expenses, (2) plant in service, (3) direct payroll, and (4) number of customers. The Four-Factor allocation percentages are

---

determined by dividing the totals for each division or subsidiary by the total for its
divisions and subsidiaries. PWC subsequently applied these percentages to its
division and subsidiaries as its allocation of the GO expenses. The allocation
factors that PWC has presented with its application for this rate case are 40.90%
for Central Basin, 29.52% for AVR, 29.41% for Missoula, and 0.17% for Jess
Ranch Irrigation, and are based on 2012 recorded data.

ORA requested PWC to update its allocation factors based on recorded
2013 data.\(^\text{169}\) This update resulted in allocation factors of 41.74% for Central
Basin, 29.29% for AVR, 28.78% for Missoula, and 0.19% for Jess Ranch
Irrigation.\(^\text{170}\) ORA reviewed, accepted, and utilized these updated Four-Factor
percentages in its estimates.\(^\text{171}\)

ORA disagrees with PWC for some of its estimated expenses for TY 2015
mainly for two reasons. First, some of the recorded expenses, which the estimation
is based on, were either not utility-related expenses or non-recurring expenses.
Second, the methodology used by PWC in its estimation did not produce a
reasonable amount. A description of disagreement, basis of the adjustment of
expenses and ORA’s estimation methodology are discussed in detail in the
following sections, wherever applicable.

ORA uses 2009 to recorded 2013 for expenses with using five-year
average. ORA uses a 1.023% escalation factor for Test Year 2015, and 1.024%
for 2016, based on ORA ECOS’ March 2014 memo estimate of the Composite
Index (composite non-labor 60%/compensation per hour 40% inflation factors),
consistent with ORA’s GRC forecasting methodology.\(^\text{172}\) ORA also updated some

\(^{169}\) ORA Data Request MUK-003.

\(^{170}\) AVR’s Response to ORA’s Data Request MUK-003.

\(^{171}\) Paragraph 3, p. 3 of A.14-01-02.

of the recorded expenses based on discovery findings to derive its suggested amount.

ORA recommends 3.71% less GO expenses than PWC for TY 2015. The differences are summarized in Table 12-A at the end of this chapter.

1) Maintenance-Other Expenses

Maintenance-Other expenses consist of GO computer hardware, software, office maintenance costs, and general plant payroll burden costs. For TY 2015, PWC proposes total Maintenance-Other expenses of $576,768. ORA recommends $431,089, which is $145,679 less than PWC. The primary reasons for the differences are described in the following section:

a) Other Maintenance General Plant (Obj. 7717, Sub 932)

Expenses in this account include the annual maintenance contracts related to PWC’s computer software systems. PWC estimated $374,538 in TY 2015 for this category of expenses at the time of its GRC application. However, PWC updated its estimate for TY 2015 to $356,361 in a response to an ORA discovery request. In its response, PWC explained “Work paper page 2-109 has been revised for the following changes: 1) MSDN subscription – This was estimated at a total of $5,950, the revised total is $632; 2) PowerPlan ($76,234) and JDE ($11,749) were inadvertently included in the amount budgeted for 2014. These amounts should have been included in the amounts proposed for 2015. The revised total for 2014 budgeted amount is $260,561. … With the above mentioned revisions, the 2015 revised total should be $356,361 (Account No. 7717.932) instead of $374,538.”

ORA’s estimated $231,298 for this category of expense for TY 2015, which is $143,240 less than PWC’s estimate. The differences are due to the use of

173 PWC’s response to DR MUK-001, q. B.2. (a).
a different estimation methodology, use of different inflation factors, and ORA’s removal of PWC’s proposal for additional software maintenance costs. 

PWC estimates expenses for TY 2015 by using a two-year (2012 and 2013) inflation adjusted average, which is not representative of the expense trend. Therefore, ORA estimates software maintenance cost for TY 2015 by using the five-year inflation adjusted average of the incurred costs (2009 to 2013). ORA also removes PWC’s additional maintenance costs for proposed new software applications, Power Plan ($76,234) and JD Edwards ($26,749), in order to be consistent with ORA’s recommendations to disallow PWC’s proposed new software applications.\footnote{ORA uses five-year average estimation method because it helps to normalize the overestimation tendency.} ORA uses five-year average estimation method because it helps to normalize the overestimation tendency.

2) Clearings-Other

PWC’s estimate for the TY 2015 is $31,646 whereas ORA’s estimate is $30,497. PWC’s estimated expense in this category is $1,148 higher than ORA’s estimate. Both ORA and PWC used five-year average method in their estimation. The difference is just due to the use of different inflation factors and different five-year average.

3) Insurance

PWC’s estimate for the TY 2015 is $172,547 whereas ORA estimates $171,843. PWC’s estimated expense in this category is $704 higher than ORA’s estimated amount. Both ORA and PWC used same methodology in their estimation. The difference is due to the use of different inflation factors and different five-year average.

4) Outside Services

PWC’s estimate of outside service expense is $723,559 for TY 2015. ORA’s estimate is $581,407, which is $142,152 less than PWC’s estimate. The

\footnote{See Chapter 8 Utility Plant in Service.}
differences are due to the use of different inflation factors and recording of non-
utility expenses as utility expenses by PWC, which is described as follows:

a) Other General Consulting (Obj. 7200, Sub 50)

PWC estimates $206,985 for Other General Consulting expenses for the
TY 2015 while ORA estimates $92,783. PWC’s estimate is $114,202 higher than
ORA’s estimate. There are mainly two reasons for the estimated differences: (1)
inclusion of a one-time, non-recurring expense in the estimation by PWC, and (2)
ORA’s removal of an unsupported expense.

First, PWC estimates its TY 2015 expenses using five-year average method
based on 2009 to 2013 recorded expenses, which include the non-recurring
consulting service fee of $100,000 paid to Mr. Henry H. Wheeler in 2012. The
Commission in D.11-12-007 adopted the settlement agreement among the
Division of Ratepayers Advocates, Western Water Holdings, LLC, PWC Merger
Sub, Inc., Park Water Company (U 314 W), and Apple Valley Ranchos Water
Company (U-346-W). Item 19 of the Appendix A of the settlement states that
consulting fees of $63,000 paid to Mr. Wheeler will be recognized as utility
expense in calculating revenue requirements for rate making purposes for 2012
and 2013 and none ($0) will be recognized in 2014. Item 20 of the Appendix states
“In future General Rate Increase applications for Park Water or AVR, those
companies agree to specifically identify any consulting fees contained in the
historic expenses incurred under any consulting agreement with Henry H Wheeler,
Jr. so that DRA will have the information to propose any adjustment it may
consider appropriate.” ORA was unable to locate within A.14-01-002 any
information provided by PWC that would comply with this requirement. Thus,
ORA removed this non-recurring consulting fee of $100,000 from 2012 expenses

---

125 PWC’s response to DR MUK-002, q. 1(c).
and estimated expenses for TY 2015 by using five-year average method based on recorded 2009-2013 expenses, excluding the $100,000 consulting fee.

Second, PWC has apportioned $100,000 annually for a proposed Operational Efficiency ("OE") Study for TY 2015. According to PWC’s General Office document, the OE study will assess performance and efficiency of the company as a whole, identify areas that are needed to be improved, develop programs and schedules to implement for the efficiency enhancement, establish a performance evaluation system, and cost $300,000 in total. However, PWC has neither explained nor provided documents showing how the proposed study will affect ratepayers in terms of costs and benefits.

Hence, ORA disagrees with PWC’s unsupported for this OE study cost estimate and finds it to be unreasonable at this time. ORA tried to understand PWC’s position and status of the study through Data Request MUK-001. In response, PWC stated, “it is not possible to provide or develop at this point a detailed and quantified cost-benefit analysis for the proposed operational efficiency study. In fact, this type of analysis is one of the primary purposes of performing the proposed study.” PWC further explained that the primary focus of the proposed study will be to review and assess the operational processes and practices of Park and its two operating subsidiaries.

From PWC’s explanations, it is apparent that the proposed OE study is premature. Prior to committing $300,000 in ratepayer funds to study operational efficiency, PWC should be required to show some indication that potential ratepayer benefits would exceed the proposed costs. Therefore, ORA recommends removing the proposed study cost of $100,000 from the PWC’s estimated budget for TY 2015.

---

176 Exhibit C – General Office Report FINAL, p. 11-12.
b) Legal Expenses (Obj. 7200, Sub 11)

PWC estimates $135,008 in legal costs for TY 2015. ORA estimates $131,551, which is $3,457 less than PWC’s estimate. Both PWC and ORA have used the five-year average method of estimation. The difference is due to the use of different inflation factors and five-year average by PWC and ORA, and ORA’s adjustment of non-utilities expenses.

ORA estimates legal expenses for TY 2015 by adjusting recorded expenses after PWC’s data responses to MUK-002, which supported removal of the following non-utility expenses from the recorded amounts.\(^{\text{177}}\)

<table>
<thead>

</tbody>
</table>

c) Audit and Income Tax (Obj. 7200, Sub 10)

PWC estimates $130,048 in audit and income tax preparation expenses for TY 2015. ORA estimates $114,172, which is $15,876 less than PWC’s estimate. The difference is due to the use of a different estimation methodology, and use of different inflation factors. To estimate its TY 2015 expenses in this category, PWC escalates a 2014 budgeted amount, which is a hard-coded number in PWC’s work papers. ORA uses the five-year average of recorded expenses escalated for inflation as its estimate. The use of five-year average method in budget estimation is more representative of the expense trend, and more reasonable than relying exclusively on PWC’s discretionary budget.

\(^{\text{177}}\) PWC’s Response to DR MUK-002, q. 2(c).
5) A&G Other

PWC estimates $558,047 for Other Administrative and General (A&G) expenses for TY 2015 while ORA estimated amount is $492,551, which is $65,496 less than PWC’s estimate. The differences are because of the use of different escalation factors and ORA’s removal of unsupported, unreasonable, or non-recurring expenses in its estimation of the TY 2015 expense amount. A description of the differences is discussed in the sections below.

a) Bank Fees (Obj. 7080)

Both PWC and ORA used the five-year (2009 to 2013) average of recorded data. PWC estimates $22,017 in bank fees for TY 2015 while ORA estimates $16,532. PWC’s estimate is $5,485 higher than ORA’s estimate. The difference is due to ORA’s removal of a one-time cost of $25,000 for a credit limit renewal fee from 2012 expenses. The inclusion of a non-recurring (one-time) cost in any year in forecasting Test Year expense cannot reasonable because this causes overestimation of future budgets.

b) Board of Directors’ Fees (Obj. 7560)

PWC estimates Board of Directors’ fees of $111,240 for TY 2015. ORA adjusts this expense to $100,000 to remove inflation. The settlement agreement between PWC and ORA (then The Division of Ratepayer Advocates) established Board of Directors' fees of $100,000 (in 2012 Dollars) for the period of 2012 to 2014 for rate making purposes. There is no need to adjust the amount for inflation since it was purposely established as a fixed amount in 2012 dollars.

\[12-9\]

---

\[12^8\] The settlement agreement (D.11-12-007), Appendix A, No. 18.
c) Travel, Lodging & Miscellaneous (Obj. 7030, Sub 1)

PWC estimates travel, lodging, and miscellaneous expenses of $100,466. ORA estimates $50,233, which is $50,233 less than PWC’s estimate.

As demonstrated in the following graph, the Travel, Lodging and Miscellaneous expense of the PWC has increased more than 400 percent\(^\text{179}\) in years directly following PWC’s acquisition by Western Water Holdings, which is owned by the Carlyle Group.

**Figure 1: Comparison of Board of directors fees and travel, lodging and miscellaneous expense**

The Commission approved ownership changes from the Wheeler family to The Western Water Holdings, LLC. on Dec 1, 2011 (effective date).\(^\text{180}\) One of the assumptions underpinning the Commission’s approval was that the transfer of

\[^{179}\] ($111,135-$22,013)/$111,135x100=404.86% (where $111,135 is the average expense of 2012-2013 and $22,013 is the average expense of 2008-2011 based on PWC provided work papers)

\[^{180}\] D.11-12-007 on A.11-01-019.
ownership would not cause any rate increase. However, subsequent to the transfer of ownership, the Travel, Lodging and Miscellaneous expense have increased by more than 400 percent in recent years. For example, the average annual amount recorded to this account from 2008 to 2011 was $22,013. After the transfer of ownership, the average annual amount recorded (2012-2013) was $111,135.

In its testimony, PWC states “the projected costs are based on 2-year averages, which coincide with the change in ownership of Park. The expense is reflective of the change in activity resulting from travel to Park’s Board of Directors meetings, which are being held at Park and its subsidiaries on a rotating basis.” Hence, ORA asked PWC through Data Request MUK-002 to provide supporting documents for the 2014 budgeted amount. PWC response provided in pertinent part as follows: “2014 budgeted amount of $97,540 is based on a 2-year escalated average because of the change in ownership of Park. This is reflective of the change in activity resulting from travel to Park's Board of Directors meetings which are being held at Park and its subsidiaries on a rotating basis.”

From the PWC’s above explanations, it is obvious that the travel and lodging expenses have been increased as a result of the acquisition of PWC by the Carlyle Group. The increased expenses in this account are questionable. PWC could have controlled the travel, lodging, and miscellaneous expenses related to board of directors’ meetings either by conducting meetings in a place where the meeting expenses could be lower or by using life-size video conferencing tools. Since PWC is solely owned by The Carlyle Group and not a SEC registered (public) company, there is no need to conduct business in different places which results in increasing expenses. Had PWC used video conferencing tools there would not be any extra expenses since PWC had subscribed such tools in yearly basis and the commission had allowed such expenses.

---

181 Exhibit C – General Office Report FINAL, p. 11.
Hence, ORA recommends an equal sharing of the PWC forecasted expenses between PWC and ratepayers. This recommendation for equal sharing of forecasted expenses in this account provides an incentive for PWC to control costs that are resulted from the corporate restructuring. It also prevents ratepayers from falling into a disadvantaged financial position as a result of increased post restructuring expenses.

6) Property Tax and Payroll Taxes
PWC calculates its GO ad valorem taxes for TY 2015 based on a prior assessed value by the assessor's office (LA County). PWC calculates average incremental tax rates per annum and then estimates $28,591 ad valorem taxes for TY 2015 by using the calculated rates. ORA has no issues with PWC’s tax rate. PWC calculates payroll taxes based on the estimated payroll amount. Payroll taxes consist of Federal Insurance Contribution Act (“FICA”), Federal Unemployment Tax Act (“FUTA”), and State Unemployment Insurance Tax Act (“SUTA”). FICA taxes include two separate components, Social Security and Medicare. PWC uses the following tax rates for its payroll tax calculation:

- FICA (Social Security) – 6.2%
- FICA (Medicare) – 1.45%
- FUTA – 0.6%
- SUTA – 4.3%

FICA (Social Security) is subject to a wage cap of $122,100, whereas FUTA and SUTA taxes are subject to a wage cap of $7,000. FICA (Medicare) is applied to total wages. ORA has no disagreement with PWC’s methodology of payroll tax calculation.

(continued from previous page)

PWC’s response to DR MUK-001, q. E(9).
D. CONCLUSION

ORA respectfully requests that Commission adopt ORA’s projections, shown in Table 12-A, for this GRC. ORA’s projections are derived from the analyses described in this chapter.

CHAPTER 13: AFFILIATED TRANSACTIONS

A. INTRODUCTION

This chapter presents ORA’s analysis and recommendations on AVR’s affiliated transactions and non-tariffed products and services (NTP&S). AVR has two affiliated transactions involving Western Water Holdings (WWH). WWH is the parent company of Park Water Company (PWC) and has no other operations. AVR mentions two contracts subject to “excess capacity” D.00-07-018 in its application. D.00-07-018 has been superseded and AVR must now comply with the rules set forth in D.10-10-009 for NTP&S. D.10-10-009 was modified in decision D.11-10-034, and D.11-10-034 was corrected in D.12-01-042.

B. SUMMARY OF RECOMMENDATIONS

<tr>
<td>Services for Western Water Holdings</td>
<td>It is recommended that services performed for WWH be added as a line-item reduction to general office expenses, during this GRC only, because the amounts are immaterial. Outside of the current, Park should report the amount of services it provides to WWH as an affiliated transaction.</td>
</tr>
<tr>
<td>HomeServe</td>
<td>All revenues from contracts with HomeServe should accrue to the benefit of the ratepayer since the annual revenues are less than $100,000.</td>
</tr>
<tr>
<td>Nextel</td>
<td>The terms of the contract appear to be reasonable. Until the contract with Nextel is terminated, revenues should continue go to the benefit of ratepayers.</td>
</tr>
</tbody>
</table>
C. DISCUSSION

1) Loan to Equity Holders

In Park Water Companies’ 2012 annual filings to DWA there was only one affiliated transaction affecting AVR. WWH granted an equity interest to certain unnamed individuals of Park Water Co. and its subsidiaries. This equity interest generated a tax liability for those certain unnamed individuals of Park and its subsidiaries. WWH offered to loan those individuals the money to pay those tax liabilities. WWH borrowed money from Park Water Company to pay the tax liability to the certain unnamed individuals of Park and its subsidiaries. Those certain individuals therefore owe Western Water Holdings who therefore owes Park/AVR $272,839.09 as of year-end 2013.

It was ORA’s concern that Park loaned WWH at a cost to Park. **BEGIN PROPRIETARY**

ORA reviewed the terms of the loan, which appear to be reasonable.

**END PROPRIETARY**

2) Services for WWH

During the rate case, it was discovered that Park does a small amount of administrative work for its parent company, WWH. Park records the amount of time its employees spend working for WWH. WWH does not have any other operations aside from ownership of Park, so the amount of services provided is relatively small, estimated at $4,035, $4,160, and $4,238 for 2015, 2016, and 2017 respectively. ORA reviewed the service contract and the terms appear to be reasonable. To account for the services performed, AVR has proposed to reduce
expenses with a line item rather than adding additional revenues to Park. ORA notes that the amounts being discussed here are immaterial, so ORA does not oppose AVR using this method during this GRC. However, outside of the current GRC, AVR should report the amount of services provided WWH in accordance with the rules governing affiliated transactions.

Accordingly, it is recommended that services performed for WWH be added as a line-item reduction to general office expenses, during this GRC. For the next GRC, Park should report the amount of services it provides to WWH as an affiliated transaction.

3) **HomeServe**

AVR has two contracts with HomeServe subject to the NTP&S decision D.12-01-042. AVR handles a small portion of HomeServe’s marketing communication as well as billing for HomeServe customers who are also AVR’s customers. Having reviewed the contracts and examined a sample payment, it appears that AVR is properly reporting its affiliated transactions as passive or active in accordance with D.12-01-042. However, the annual other operating revenues from HomeServe’s contracts for 2013 were $1,175 which do not meet the $100,000 threshold needed for Park to benefit from revenue sharing. Therefore, all revenues generated from HomeServe should benefit ratepayers.

All revenues from contracts with HomeServe should accrue to the benefit of the ratepayers since the annual revenues are less than $100,000.

4) **Nextel**

Nextel has a lease arrangement with AVR to semi-permanently mount equipment on top of AVR’s water tanks. ORA reviewed the lease terms, which appear to be reasonable. Since annual lease income is for 2013 was only $10,104,

---

189 HomeServe provides emergency repair services for AVR’s customers during off-hours.

190 A.14-01-002 pp. 7-8.

less than $100,000, AVR should not allocate revenues. Under D.12-01-042, Rule X.C.6, all proceeds should go to the benefit of ratepayers. AVR is in the process of terminating their contract with Nextel, at Nextel’s request; however, disposition of the lease has not been determined yet.

The terms of the contract appear to be reasonable. Until the contract with Nextel is terminated, annual revenues should continue to accrue to the benefit of ratepayers.

D. CONCLUSION

In general, all of AVR’s affiliated transactions appeared to be reasonable. In regards to NTP&S, it appears as though AVR is incorrectly allocating revenues that should go exclusively to the benefit of ratepayers. It is recommended that AVR should follow the guidance provided for in D.12-01-042 and only allocate other operating revenues between ratepayers and shareholders when other operating revenues are in excess of $100,000.

---

CHAPTER 14: MEMORANDUM AND BALANCING ACCOUNTS

A. INTRODUCTION

This chapter presents ORA’s analysis and recommendations on AVR’s requests related to its existing balancing and memorandum accounts. The GRC is the appropriate time for a comprehensive review of all the balancing and memorandum accounts and while all accounts were reviewed, the recommendations in this chapter only address the accounts that were specifically requested in AVR’s GRC A.14-01-002. AVR has 8 balancing accounts and 16 memorandum accounts. The combined balance of all of AVR’s balancing and memorandum accounts as of year-end 2013 is $4,787,831.\textsuperscript{193} This net amount to be recovered via surcharges on customer bills is approximately 22% of AVR’s current $22 million in authorized revenue requirements.\textsuperscript{194} For a complete list of all of AVR’s balancing and memorandum accounts and their balances, please see Attachment A at the end of the chapter.

During the review of AVR’s balancing and memorandum (memo) accounts, ORA identified issues regarding the practice, procedure, and maintenance of the accounts. These issues will be discussed below under Section C. Discussion below.

B. SUMMARY OF RECOMMENDATIONS

<table>
<thead>
<tr>
<th>Description</th>
<th>Summary of Recommendations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Booking Recovery to Memorandum Accounts</td>
<td>AVR should not treat memorandum and balancing accounts interchangeably. Once memorandum accounts are approved for recovery, AVR should move them to a balancing account.</td>
</tr>
</tbody>
</table>

\textsuperscript{193} Attachment A – This figure is the sum of all balancing and memorandum account balances according to response to DR ROY-003. Amount includes estimates made by AVR.  
\textsuperscript{194} In A.14-01-002, AVR is requesting recovery of $3,506,309 of the total $4,787,831.
<p>| Memorandum Accounts Recorded on the Balance Sheet | AVR should not record memorandum accounts on the balance sheet until the Commission approves those amounts for recovery. Memorandum Accounts should not be treated as regulatory assets. |
| Application Requests | The GRC is the appropriate time for balancing and memorandum accounts to be reviewed and settled. |
| Use of Estimates | Under no circumstances, should AVR be permitted to seek recovery of estimated amounts that the company has “recorded” in balancing or memorandum accounts. |
| WRAM/MCBA Balancing Account | Since AVR filed its 2013 WRAM/MCBA balances on May 6, 2014 via Advice Letter 190, the balances will be reviewed within the context of the Advice Letter. |
| Incremental Cost Balancing Account - Irrigation | Since the ICBA account balance is estimated, ORA does not recommend recovery at this time. |
| Pension Expense Balancing Account | ORA recommends the refund of over-collections of the Pension Expense balancing account in the amount of $22,427. ORA also recommends the account be continued until the next general rate case. |
| Conservation Memorandum Account | Since the amounts appear to be reasonable, ORA recommends recovery of the under-collected Conservation Memorandum Account in the amount of $77,384. |
| Outside Services Memorandum Account | ORA recommends the recovery of the remaining balance, including interest, of $2,006 in the Outside Services memorandum account. ORA also recommends the account be closed. |
| Pressure Reducing Memorandum Account | Due to the fact that the technology is no longer being considered by AVR, and there is a zero balance in the account, ORA recommends closing the Pressure Reducing Valve Memorandum Account. |</p>

### C. DISCUSSION

1) **Accounting Issues Regarding Memorandum Accounts**

AVR treats its balancing and memorandum accounts the same with no distinction between the two types of accounts. Standard Practice SP-27-W explains the difference between balancing and memorandum accounts. Balancing accounts are kept on the balance sheet, are used to track recovery or amortization

---

195 Response to DR ROY-006, Question 1.
of amounts authorized by the Commission, and include amounts that were tracked in a memorandum or reserve account and authorized for recovery.\textsuperscript{196} Memorandum accounts, on the other hand, are not assured recovery, are kept off the books, and are only to be used to track costs for reasonableness review by the Commission.\textsuperscript{197} In D.12-09-004, The Commission clarified the distinction between the two types of accounts as follows:

There is an important regulatory distinction between a balancing account and a memorandum account: the Commission has clearly established that a balancing account is used where recovery is essentially assured, subject to determining the reasonableness of the amounts incurred, so that ratepayers as well as shareholders are protected from forecast error. A memorandum account on the other hand has no assurance of recovery until the underlying program or project is subsequently deemed reasonable … The purpose of a balancing account is simply to protect against over- or under-collections, unlike a memorandum account where we have yet to determine that the expense category is eligible for recovery from ratepayers.\textsuperscript{198} … There is another distinction as well: a balancing account usually has a revenue stream attached to it so that the cost is tracked against the initial amount of revenue provided in rates. A memorandum account by contrast usually only records the expenses which will be considered for recovery later.\textsuperscript{199}

It is clear that the purposes of balancing and memorandum accounts are different. It is also clear that the accounting treatment for these accounts must be distinct. AVR however, does not make any distinction between the two types of accounts. This raises two important concerns with AVR’s current practices: one, treating a memorandum account like a balancing account may cause account balances to be recovered without Commission review, and two, AVR may use the

\textsuperscript{196} SP-U-27-W p.6 No.29-31.
\textsuperscript{197} SP-U-27-W p.4 No.24-25.
\textsuperscript{198} D.12-09-004 pp.13-14.
\textsuperscript{199} D.12-09-004 p. 13. Footnote 4.
fact that it records memorandum accounts on the balance sheet as justification for
Commission approval. Each concern is addressed in the following paragraphs.

a) Discussion

i. Booking Recovery to Memorandum Accounts

AVR treats its memorandum accounts like its balancing accounts, with no
distinction between the two. This means that when a memorandum account is
authorized for recovery, the revenue from the associated surcharge is booked in
the same account as an offset to under-collected balances of that account. This is
not in accordance with the recommended practices in SP-U-27-W. SP U-27-W
recommends that once a cost tracked in a memorandum account is authorized for
recovery, the authorized amount is moved to a balancing account for recovery.
The memorandum account zeroes out and any further costs tracked in the
memorandum account will be reviewed for recovery at a later date. This method
prevents newly tracked costs from being comingled with amounts that are
currently being recovered, but have not yet been fully recovered. Since AVR does
not use this method for its memorandum accounts, it raises concerns that costs
tracked in memorandum accounts may not be subject to a reasonableness review
and could potentially be recovered without Commission review.

Treating a memorandum account as a balancing account could cause AVR
to recover account balances that have not been reviewed for reasonableness. The
amount of a surcharge applied to a customer bill to recover an under-collected
balance is forecasted based upon estimates of customers and consumption. If the
actual number of customers or consumption is greater than the forecast used to
develop the surcharge, the amount collected from the surcharge will be more than
the initial balance. Since AVR co-mingles the collection from surcharges with the
recording of costs, the same memorandum account continues to track new costs.
If the amount collected from higher-than-anticipated surcharge revenue is netted
against newly tracked costs, as AVR does, the newly tracked costs may never be
reviewed since they would appear as having been already recovered. Clearly,
AVR should not be allowed to recover any amounts that are not approved by the Commission.

To prevent this type of situation from happening, once memorandum accounts’ balances are approved for recovery, consistent with SP-U-27-W AVR should move them to a balancing account for recovery or amortization.

ii. Memorandum Accounts Recorded on the Balance Sheet

AVR books its memorandum accounts on the balance sheet as either a regulatory asset or regulatory liability and not in accordance with practices recommended in SP-U-27-W. This practice violates the overall accounting concept of conservatism. AVR should not report any contingency gains on their financial statements until the amounts are realized. ORA is concerned that AVR records its memorandum accounts on the balance sheet because this practice may lead the Commission to authorize recovery for no reason other than to avoid the implications of an asset write-down. In D.05-07-045, Southern California Water Company (SCWC) used the same accounting treatment of its memorandum accounts in regards to litigation costs. SCWC had booked its litigation memorandum accounts on the balance sheet, citing that FAS No. 71 allowed for such when costs had a high probability for recovery. SCWC argued that if it could not recover the amounts recorded on its balance sheet, the company would suffer undue financial hardship from the effects of writing down the regulatory asset on the balance sheet. Financial hardships could include cost of restating past financial statements, violation of loan terms, loss of credit availability, loss of investors, and unfavorable financing rates. The Commission agreed SCWC would suffer financial hardship and so the Commission reluctantly authorized recovery.

---

200 Response to DR ROY-001 Question 4. See attachment B.
201 As defined SFAC No.2 and updated in SFAC No. 8.
202 ASC 450 – Contingencies.
203 D.05-07-045 Sections 4.5 & 4.6.
The Commission should not be placed into a similar predicament by AVR. The company can choose its accounting methods; however, the concern is that this particular accounting method will be used by AVR to help guarantee recovery of its memorandum account balances even if those amounts are not considered reasonable by the Commission.

It is recommended the Commission order AVR to alter its accounting methods to avoid recording memorandum accounts on the balance sheet until those amounts are approved for recovery by the Commission.

b) Conclusion

For both situations regarding the accounting treatment of its balancing and memorandum accounts, it is recommended that AVR alter its accounting methods; AVR should not co-mingle the tracking of costs and the recovery of costs in the same account and AVR should not record memorandum accounts on the balance sheet. The Commission should order AVR should follow the guidance provided in SP-U-27-W in regards to its balancing and memorandum accounts. If the Commission does not, it may allow AVR to recover amounts that have not been reviewed by the Commission. In addition, if AVR is not ordered to change its practices, the Commission may be placed in a predicament when it must guarantee recovery to avoid the effects of an asset write-down.

2) Application Requests

a) Discussion

AVR has conflicting application requests and Data Request responses. In its GRC application, AVR requests “review and disposition” of certain balancing and memorandum accounts. AVR clarified during ORA’s walk-through visit on January 23, 2014 that this was meant as either recovery or refund of the

---

204 A.14-01-002, pp. 9-12.
account balances. However, when asked to provide a list of accounts for which 
AVR intended to seek recovery, all related work-papers, and all general ledger 
data in Data Request ROY-001, AVR stated in response that “final account 
balances cannot be determined at this time” for several of the accounts including 
the following: Office Remodel Balancing Account, Employee and Retiree 
Healthcare Balancing Account, Group Pension Balancing Account, and One-Way 
Conservation Expense Balancing Account. AVR proposes that the accounts be 
recovered through advice letter filings after the current rate case cycle is 
completed. D.06-04-037 states: “Class A water utilities shall report on the status 
of their balancing and memorandum accounts in their general rate cases and shall 
propose adjustments to their rates in that context to amortize under- or over- 
collections in those accounts subject to reasonableness review. They also may 
propose such rate adjustments by advice letter at any time that the under- or over- 
collection in any such account exceeds two percent (2%) of annual revenues for 
the utility or a ratemaking district of the utility”.

b. Conclusion

The GRC is the appropriate time for balancing and memorandum accounts 
to be settled. D.06-04-037 only allows advice letter filing for 
balancing/memorandum account recovery in between rate case cycles when the 
balance exceeds 2% of annual revenues.

3) Use of Estimates

a) Discussion

AVR uses estimates in some of its balancing accounts. In AVR’s 
WRAM/MCBA and in the ICBA-Irrigation Balancing Accounts, AVR estimates 
the amount it spends for replenishment and leased water rights and to a lesser
extent, purchased power. AVR states the reason for the estimate is due to a long lag time in billing from the Mojave Water Agency. AVR states the Mojave Water Agency uses a retroactive calculation methodology in producing its bill, and can take more than a year until actual amounts are known to AVR. AVR also states that purchased power can take up to six-months to be billed. The purpose of these balancing accounts is to track the difference between authorized costs and actual costs. By estimating the actual amount tracked in their accounts AVR is comparing two estimated numbers, which is an incorrect application of the accounts.

b) Conclusion

The Commission should not allow AVR to recover estimated amounts that the company has “recorded” in balancing or memorandum accounts.

4) WRAM/MCBA Balancing Account

AVR requests the Commission review and authorize under-collected balances in the WRAM/MCBA. The purpose of WRAM/MCBA is to track the difference between authorized and actual water quantity revenues and water production costs related to increased conservation activities. The authority to establish this account was granted in D.08-09-026.

ORA did not review the WRAM/MCBA balances in the GRC. On May 6, 2014, AVR filed its Advice Letter 190 requesting to recover the 2013 balance per the settlement. ORA will review the Advice Letter and the amount being requested.

5) Incremental Cost Balancing Account (ICBA) - Irrigation

AVR requests the Commission approve recovery of the under-collected balances of the Incremental Cost Balancing Account (ICBA) for the estimated amounts of $3,095.
The ICBA tracks incremental differences in authorized water productions costs and actual water production costs. This account was authorized by the Commission in D.03-06-083. The last authorized recovery date of this account is April 26, 2013 through Tier 1 Advice Letter 183-W for the amount through the end of March 2013 of $477,575. AVR has changed its position on recovery in this GRC in favor of recovery through an advice letter filing at a later date.

ORA does not recommend recovery at this time since account balances are estimated. It is recommended that AVR be eligible to seek recovery of ICBA balances once costs are no longer estimated.

a) Examination Scope and Objectives

ORA examination scope and procedures include verifying the amount to be refunded, verifying the reasonableness of the benefit, and verifying the volatility of the expense.

b) Examination Procedures and Results

ORA has read applicable decisions and advice letters, reviewed AVR’s work-papers, beginning and ending account balances, amounts to be recovered, supporting payment checks, the irrigation customer group tariff, leased water rights contracts, and sampled invoices. ORA was able to verify expenses recorded in the account, except those that AVR had recorded as estimates due to a lag in invoicing. AVR’s lag in invoicing is primarily from the Mojave Water Agency, which uses a retroactive calculation method to determine the amount charged to AVR. The lag is significant and according to AVR’s representatives, could be over a year in length. There is also a small lag in invoicing for AVR’s purchased power. AVR is aware of the timing differences and therefore estimates the invoice amount until actual amounts are known. This methodology is incorrect. The purpose of a balancing account is to track the difference between projected and recorded amounts; not the difference between projected and estimated amounts.
AVR should not record a cost in a balancing or memorandum account until the cost is incurred. Aside from AVR’s estimated costs, all other costs recorded in the account appeared to be reasonable and were properly supported.

c) Conclusion

Since the ICBA account balance is estimated, ORA does not recommend recovery for the under-collected account balances at this time.

6) Employee and Retiree Health Care Balancing Account

AVR requests that the Commission approve a refund of the over-collected balance of $285,653 and to allow the account to continue to track difference between projected and actual Employee and Retiree Health Care. AVR has changed its position to wait until the end of the rate case cycle to see if costs will reduce the amount to be refunded to an under-collection before attempting to seek recovery through an advice letter filing.

The Employee and Retiree Health Care balancing account tracks the difference between actual and authorized health care expense amounts. This account was authorized in D.12-09-004.

ORA recommends the refund of over-collections in the amount of $285,653. ORA also recommends the account be continued until the next general rate case.

a) Examination Scope and Objectives

ORA examination scope and procedures include verifying the amount to be refunded, verifying the reasonableness of the benefit, and verifying the volatility of the expense.

b) Examination Procedures and Results

ORA’s examination procedures included reading related decisions and advice letters, reviewing employee benefits plan and evaluating it for reasonableness, reading provider contract and determine what level of service is
provided, verifying beginning and ending account balances and amount of expense, and sampling payment checks. AVR’s Employee and Retiree Health Care Balancing Account balances through year end 2013 appear to be reasonable.

c) Conclusion

ORA recommends the refund to ratepayers of over-collections in the amount of $285,653. ORA also recommends the account be continued until the next general rate case.

7) Pension Expense Balancing Account

AVR requests the Commission approve a refund of the over-collected balance of $22,427 and to allow the account to continue to track difference between projected and actual pension expenses. AVR has subsequently stated it would prefer to handle disposition of the account outside of the GRC. AVR wishes the account continue until the end of the rate case cycle in hopes the amount of over-collection will be reduced at which point disposition of the account would be handled through an advice letter filing.

The Pension Expense Balancing Account tracks the difference between actual and authorized health care benefits expense amounts. This account was authorized in D.12-09-004.

ORA recommends the refund of over-collections of the Pension Expense Balancing Account in the amount of $22,427. ORA recommends the account be continued until the next general rate case.

a) Examination Scope and Objectives

ORA examination scope and objectives include verifying the amount to be refunded, the reasonableness of the pension expense, and the volatility of the expense.
b) Examination Procedures and Results

ORA examination procedures included: reading applicable decisions and advice letters, reviewing actuarial report and estimates, AVR’s pension plan, beginning and ending account balances and amounts to be refunded. ORA’s examination did not detect any abnormal amounts or unusual trends. The account balances appear to be reasonable and were spent in accordance with the terms of the balancing account.

c) Conclusion

ORA recommends the refund to ratepayers of over-collections of the Pension Expense Balancing Account in the amount of $22,427. ORA also recommends the account be continued until the next general rate case.

8) Conservation Memorandum Account

AVR requests the Commission approve recovery of expenses associated with the Conservation Memorandum Account for the period of January 1, 2011 to December 31, 2011 for the balance of $77,384.

The Conservation Memorandum Account tracks certain costs associated with “Best Management Practices” outlined in the Memorandum of Understanding adopted by the California Urban Water Conservation Council. This account was authorized in Decision D.08-09-026.

ORA recommends recovery of the under-collected Conservation Memorandum Account in the amount of $77,384.

a) Examination Scope and Objectives

ORA examination scope and procedures include verifying the requested recovery amount including interest and determining the eligibility of recovery.
b) Examination Procedures and Results

ORA’s examination procedures included: reading applicable decisions, advice letters, and related documents; verifying beginning and ending account balances; reconciling amounts provided in Data Requests and in work papers; reviewing expense receipts. ORA’s examination did not reveal any unusual activity. The amounts appeared to be reasonable and spent in accordance with terms of the account.

c) Conclusion

Since the amounts appear to be reasonable, ORA recommends recovery of the under-collected Conservation Memorandum Account in the amount of $77,384.

9) Outside Services Memorandum Account

AVR requests the Commission approve recovery of under-collected balances in the Outside Services Memorandum Account for the amount of $2,006. The outside services account was created to track the costs associated with the potential risk involving the Mojave Water Agency project. This account was authorized in D.08-09-026. The account automatically tracks expenses until year-end 2011. The account balance was last authorized for recovery in September 2012 in Advice Letter 177-W for balances up to year-end 2010. ORA recommends the recovery of the remaining balance, including interest, of $2,006 in the Outside Services memorandum account. ORA also recommends the account be closed.

a) Examination Scope and Objectives

ORA examination scope and procedures include verifying the requested recovery amount including interest and determining the eligibility of recovery.
b) Examination Procedures and Results

Examination procedures included reading applicable decisions and advice letters, verifying the account balance, and examining the invoices for appropriateness. There was only one invoice to examine which appeared to be reasonable and appropriate.

c) Conclusion

The examination revealed the account balance to be reasonable. Thus, ORA recommends the recovery of the remaining balance, including interest, of $2,006 in the Outside Services memorandum account. Since there was only one expense tracked in this account, ORA also recommends the account be closed.

10) Pressure Reducing Memorandum Account

AVR requests the Commission to approve the closure of the Pressure Reducing Valve Memorandum Account.

The Pressure Reducing Valve memorandum account tracks the cost associated with implementing pressure reducing valve modernization technology into AVR’s water system. This account was authorized in D.12-09-004.

ORA does not object to AVR’s request, and agrees with AVR’s recommendation to close the Pressure Reducing Valve Memorandum Account.

a) Examination Scope and Objectives

ORA determines if it is appropriate to close the Pressure Reducing Valve Memorandum Account.

b) Examination Procedures and Results

Examination procedures will include reading applicable decisions, determining the reason AVR wishes to close the account, and verifying the account has a zero balance. AVR representatives stated that AVR looked further in to implementing this technology into its current water system but could not
implement the technology effectively. AVR’s engineers discovered that the new technology would be incompatible due to the lack of water pressure needed for the valves to work properly. The project was no longer under consideration from AVR and thus no expenses were tracked in the account. This was further verified in responses to Data Requests ROY-001 and ROY-003.

c) Conclusion

Due to the fact that the technology is no longer being considered by AVR, and there were no costs recorded in the account, ORA recommends closing the Pressure Reducing Valve Memorandum Account.

11) Office Remodel Balancing Account

AVR requests the Commission approve recovery of under-collected amounts of revenue requirement associated with its office remodeling project. The amount AVR is requesting to be recovered, including interest is $24,905.

The Office Remodel Balancing Account tracks the revenue requirement associated with the office building remodeling project that was proposed in the last GRC. This account was authorized in decision D.12-09-004.

ORA does not recommend recovery of the Office Remodel Balancing Account. It is recommended the amounts tracked in the account be removed and the account be closed.

a) Examination Scope and Objectives

ORA examination scope and procedures include verifying the requested recovery amount including interest and determining the eligibility of recovery.

b) Examination Procedures and Results

Examination procedures include reading applicable decisions and advice letters, verifying the account balance, project costs, and rate of return calculations. ORA found unauthorized amounts recorded in this balancing account. The
authorizing decision states: “Therefore we will do the following: Ranchos may have a balancing account, that will be subject to a reasonableness review, to recover the revenue requirement for the project effective once the construction is completed.” However, ORA has found that the project was no longer an office remodel, but a completely new office building project. AVR clarified that the purpose of this account was for a remodel and not a new office building. The purpose of this account is to track the revenue requirements on a completed office rebuild or remodel project and since the project is not complete, there should be no costs recorded in this account and no recovery. Since the project is now far beyond the scope of an office rebuild or remodel, it is recommended that this account be closed.

c) Conclusion

ORA recommends denying recovery of any amounts recorded in the Office Remodel Balancing Account. Further, AVR should remove any amounts already recorded in the account. ORA recommends the account be closed since the project no longer a rebuild or remodel and has not completed the project within the 3-year rate case cycle. Additionally, ORA recommends that AVR bear the full burden of amounts already incurred expenses for its abandoned rebuild or remodel project or its new office building project, since a new office project was not authorized for this balancing account.

12) Solar Project Memorandum Account

In its Application, AVR states that it is in the preliminary stages of investigating the potential for installing an AC solar photovoltaic generation

---

D.12-09-004 p. 18.

D.12-09-004 p.17 Footnote 5 states: “In comments Ranchos and DRA correctly point out the proposed decision mischaracterized these changes as a ‘new building’ whereas the changes are really modifications and reconfigurations to the existing building which effectively results in a ‘new office space’. This correction of characterization does not affect the findings that the (continued on next page)
system on the grounds of its office site. AVR is undertaking a feasibility analysis of placing panels on a proposed service vehicle shelter and carport shade structures to be installed in the employee parking lot. AVR requests that the Commission authorize a new memorandum account to track the costs, expenses, and capital costs associated with this solar project. AVR does not provide any estimate of the expected costs of this project because the costs are currently unknown and uncertain. Accordingly, AVR states that it cannot readily forecast them in this GRC.

Nonetheless, AVR says that it anticipates obtaining a proposal from a design/build vendor to install a solar photovoltaic system during the rate case process and will provide the proposal to Staff for review. ORA opposes this request because AVR contradicts itself by saying on the one hand it plans to provide a proposal from a vendor for staff to review during the rate case process but, on the other hand, that it cannot readily forecast the cost in this GRC. This implies that the vendor proposal that AVR plans to submit would not have any cost information, which is not reasonable because a solar panel vendor should be able to prepare and present the estimated costs associated a detailed proposal. Clearly, AVR should be able to estimate the total cost of a solar project with a well-defined scope and scale and would, therefore, not need to request a memo account for this purpose. AVR has not disclosed how many turn-key solar panel system vendors it has consulted, or which of several system installations and financing arrangements it has considered. AVR’s inability to obtain a cost estimate for this project remains unexplained, and therefore, lacks the justification required for Commission approval of such expenditures for ratemaking purposes.

(continued from previous page)
project need has been justified subject to the recovery restrictions included herein”.

14-18
In AVR’s Response to ORA’s Data Request\textsuperscript{208}, AVR describes a solar project that is potentially much broader in scope than it originally described in its Application, as follows:

Additionally, AVR has shared its electrical load information with a renewable energy developer vendor, with the intent of exploring the possibility of a single plant supplying the aggregate load from our well sites. We are presently in discussions with Indian Energy to determine how much land is needed for a solar site to produce enough electricity to meet the electrical demand from our well sites.

AVR’s proposed solar project does not qualify for a memorandum account because it is open-ended and undefined. Granting a memorandum account for such a proposal would not provide the proper incentives for economically efficient investments. Nor does AVR’s vague, undefined proposal meet the Commission’s least-cost criterion, which requires that AVR demonstrate that its proposal represents the least cost option among all possible alternatives. In contrast, the Commission’s approval of a reasonable cost estimate of a specific plan to install solar panels on its parking structures would give AVR an incentive to invest economically. The Commission should consider this request only after AVR presents it in the form of a quantifiable, tangible proposal, showing justification of its economic efficiency by including a cost benefit analysis. Accordingly, ORA recommends that the Commission deny AVR’s request for approval of a memorandum account for a solar panel project in this GRC because it is ill-defined and, when adequately defined, its costs will be estimable. If the Commission reviews and finds these costs reasonable in a future GRC, it may include them in AVR’s Rate Base.

\textsuperscript{208} ORA’s Data Request JJS-003, Q. #3.
13) **Credit Card Memorandum Account**

AVR requests that the Commission review the Credit Card Memorandum Account balances for approval and disposition. The purpose of the Credit Card Memorandum Account is to track the costs and savings associated with providing credit/debit card payment services. AVR requests that the Credit Card Memorandum Account be closed after disposition.

Resolution W-4935, authorized this memorandum account “to record all costs associated with the credit card program previously authorized in rates that were or are incurred to support the credit and debit card payment options. The memorandum account shall also include any savings associated with offering the program. The net balance in the memorandum account shall be refunded to customers as part of Apple Valley’s next general rate case.”

AVR reports that this memorandum account has a zero balance and that AVR does not plan to use it further. ORA inquired about the details of this account. AVR responded, with the following explanation:

Please note that on the attached schedule the credit card memorandum account reflects a balance of $0. AVR did not book an amount for this account for year-end 2013 accounting because the estimated balance was considered de minimis (approximately a few thousand dollars) and more importantly because AVR has been struggling with interpreting the language in Resolution in W-4935 regarding how to calculate the credit memorandum account which is less than clear. AVR intended to file an advice letter refunding the balance recorded in the credit card memorandum account through year-end 2014 in February of 2015 after a final balance had been calculated and was available. Upon further examination, AVR finds that Resolution W-4935 requires the balance in the memorandum account to be refunded to the general body of ratepayers as part of this GRC proceeding. Therefore AVR is currently working on

---

211 AVR’s 3/10/2014 Response to ORA Data Request ROY-003, p. 2.
preparing its best estimate of a projected year-end 2014 balance for
the credit card memorandum account and will provide it to you for
review as soon as possible.

ORA recommends approval of AVR’s request, subject to ORA’s review.
ORA has not yet had the opportunity to review and determine the reasonableness
of AVR’s memorandum account balance because AVR has not yet provided ORA
with its calculations for this account. AVR should be permitted to close the credit
card memorandum account subject to this review. Although AVR states in the
quote above that AVR intends to provide the estimated year-end 2014 balance as
soon as possible, ORA does not yet know if AVR will provide the information in
time for ORA to make an informed assessment of the memorandum account prior
to ORA’s submission of ORA’s final recommendations in this GRC. In order to
comply with the Commission’s OP 4 of W-4935, AVR must timely provide these
data for review in the current GRC. ORA recommends that the Commission allow
AVR to dispense with the Credit and Debit Memorandum Account subject to
AVR’s timely provision of the detailed calculations of the estimated year-end
2014 balance in this GRC and ORA’s review and recommendations thereon.

14) 2010 Tax Act (Bonus Depreciation) Memorandum Account
AVR requests the Commission review its 2010 Tax Act\textsuperscript{212} (related to Bonus
Depreciation) Memorandum Account (Memo Account) for “approval and
disposition.” AVR further requests that the account be closed after disposition.\textsuperscript{213}
In its response to ORA Data Request JRC-001, AVR articulated a number of
requests related to this issue in an attempt to respond to ORA’s inquiry over
exactly what is being requested in this proceeding. The summation of the

\textsuperscript{212} Tax Relief, Unemployment Insurance Reauthorization, and Job Creation Act of 2010.
\textsuperscript{213} AVR Application A.14-01-002, p. 11.
explanation given is unclear and confusing to ORA, specifically on the question of
whether or not AVR has included in rates, the tax benefits related to the Tax Act.
Resolution L-411A authorized AVR to establish a one-way memorandum
account to track the impacts of the Tax Relief, Unemployment Insurance
Reauthorization, and Job Creation Act of 2010 (Tax Act). The Commission
required creation of the Bonus Depreciation Memorandum Account as a result of
the 2010 Tax Act relating to Bonus Depreciation to track ratepayer benefits
associated with Bonus Depreciation. The Memo Account applies to all cost-of-
service rate-regulated utilities that do not address the new tax law in a 2011 or
2012 general rate case.

ORA posed several questions related to this request in ORA Data Request
Number JRC-001. AVR stated that the Memo Account is tracking the cumulative
revenue requirement of the Tax Act from the effective date of the resolution (April
14, 2011) up to the point when those impacts are incorporated into rates, which
will be the effective date of the rates resulting from this general rate case
proceeding, or January 1, 2015. AVR asserted that the impacts of the Tax Act are
reflected in this general rate case in the deferred tax calculations and that the 2015
and 2016 balances of the deferred tax reserve used as a rate base reduction in this
general rate case incorporates the applicable Tax Act bonus depreciation.214 AVR
stated that the balance in the Memo Account will not be known and available for
amortization (included in rates) until January 1, 2015. Therefore, it appears that
AVR has not, to date, flowed-through to ratepayers, the cumulative revenue
requirement impacts of the tax benefits of the Tax Act.

In its response to the data request, AVR stated that it is not requesting that
the Memo Account be closed prior to January 1, 2015, and AVR is not requesting
that any specific balance be approved for amortization in this proceeding because
the final balance will not be known until after the record is closed. On the other

214 AVR Response to ORA Data Request JRC-001, Q.1.
hand, AVR stated that it is requesting that the Commission find that the impacts of
the Tax Act are incorporated into the rates resulting from this proceeding and, as
of the effective date of those rates, those impacts should no longer be tracked in
the Memo Account. AVR has not to date, passed to ratepayers the cumulative revenue
requirement impacts of the tax benefits of the Tax Act, even though it knew of the
accumulated entries into the Memo Account since it was created in 2011, through
2013. The entries and accumulated balance of the Memo Account need to be
examined through a detailed audit conducted by the Commission’s Division of
Water and Audits (DWA) to determine the correct amount to be flow-through to
ratepayers. The net accumulated tax benefit should be flowed through to
ratepayers, albeit, retroactive, beginning the effective date of the ensuing Advice
Letter.

ORA is unable to recommend at this time that the Commission find the
impacts of the Tax Act will in fact be incorporated into rates resulting from this
general rate case proceeding. ORA is further unable to recommend that as of the
effective date of those rates, the impacts of the Tax Act should no longer be
tracked in the Memo Account.

ORA recommends that the Commission order an audit of AVR’s Tax Act
Memo Account to determine the exact amounts of the entries into it since its
inception, and to determine the balance in the account subject to amortization.
After the Memo Account is audited, AVR should be required to file an Advice
Letter in early 2015 to flow-through to ratepayers the cumulative revenue
requirement associated with the impact of the net tax benefits of the Tax Act
accumulated to date.

AVR Response to ORA Data Request JRC-001, Q.1(e).
15) Chromium-6 Memorandum Account

AVR seeks the Commission’s authority to establish a Chromium 6 Memorandum Account to track unknown costs for water treatment or remediation of water sources that would result from exceeding the maximum contaminant level (“MCL”) for hexavalent chromium (“Cr6”) to be adopted by the California Department of Public Health (“CDPH”). Cr6 is a heavy metal that is known to cause cancer when inhaled or ingested and is naturally occurring in low concentrations in many parts of the state. The presence of Cr6 in the environment is also attributed to industrial activities such as the manufacturing of textile dyes, wood preservation, leather tanning, and anti-corrosion coatings.218

On August 23, 2013, the CDPH submitted its proposed standard for maximum contaminant levels (“MCL”) of 10 ppb for Cr6 to the Office of Administrative Law (“OAL”) for publication in the California Regulatory Notice Register. In December 2013, the Alameda County Superior Court ordered the CDPH to finalize its MCLs for Cr6 by Spring 2014. On April 15, 2014, the CDPH submitted the proposed final regulation establishing the MCL for Cr6 at 10 ppb to the OAL for a 30-day review. Under the Administrative Procedure Act, the OAL has 30 working days to review and approve or disapprove the proposed filing. The CDPH anticipates that OAL will make a determination by May 30, 2014. In short, the CDPH proposes to regulate Cr6 at 10 ppb and expects the OAL to approve the regulation with an implementation date of July 1, 2014.219

At the time of AVR’s GRC filing, the CDPH only proposed a draft MCL at 10 ppb and although AVR’s latest water quality samples from wells do not indicate Cr6 levels above CDPH’s proposed MCL,220 AVR is requesting in this

---

219 The CDPH’s April 15, 2014, Press Release (Attachment C).
220 Revenue Requirement Report, p. 129.
GRC a Chromium 6 Memorandum Account in case the CDPH further lowers the final standard. However, the CDPH did not make changes to the proposed standard and finalized the standard at 10 ppb on April 15, 2014. Since the CDPH proposes a final MCL of 10 ppb and AVR’s wells do not exceed the MCL level, AVR does not need to provide treatment at any of its wells, therefore, a memorandum account is not needed to track treatment costs.

AVR’s main source of water supply comes from 21 underground wells and none of the wells contains Cr6 levels above CDPH’s proposed final MCL. Although AVR’s Revenue Requirement Report shows that water samples collected from 16 wells in 2002 and 2011 detected Cr6 levels above 1000 parts per trillion ("ppt"), it is important to note that 1000 ppt is equivalent to 1 parts per billion ("ppb"), which is below CDPH’s proposed final MCL for Cr6 of 10 ppb. AVR’s Revenue Requirement Report also discloses that none of AVR’s wells contain Cr6 levels above CDPH’s proposed MCL of 10 ppb.

AVR claimed that it may need to install treatment facilities at its wells if the CDPH decides to adopt a lower MCL than the proposed level of 10 ppb. Since AVR’s filing, the CDPH has finalized its MCL at the proposed level on April 15, 2014. With the CDPH’s latest action solidifying California’s regulation of Cr6 at 10 ppb and the fact that none of AVR’s wells are impacted with Cr6 above this level, AVR will not need to install treatment facilities or incur treatment cost. Therefore, AVR does not have any treatment costs to track related to the new Cr6 regulation and hence need a memorandum account for this purpose.

For the reasons stated above, ORA strongly recommends that the Commission deny AVR’s request to establish a Chromium 6 Memorandum Account.

---

221 AVR’s Revenue Requirement Report, p. 128.
222 See Table set forth in AVR’s Revenue Requirement Report, p. 129.
D. CONCLUSION

In general, AVR’s balancing and memorandum accounts appeared to be reasonable except where noted above.

AVR uses the same accounting treatment for its balancing and memorandum accounts and it should not since it could use its accounting methods to justify recovery of otherwise unreasonable amounts, or recover amounts that have not been reviewed by the Commission. ORA recommends that AVR change its accounting treatment of its balancing and memorandum accounts in accordance with the guidelines found in SP-U-27-W.

AVR should not use advice letters for recovery outside of the GRC unless account balances exceed 2% of annual revenues. As clarified in D.06-04-037, “Class A water utilities shall report on the status of their balancing and memorandum accounts in their general rate cases and shall propose adjustments to their rates in that context to amortize under- or over-collections in those accounts subject to reasonableness review…” The ideal time to handle balancing and memorandum accounts is during the GRC.

AVR should not be permitted to use estimates in its balancing and memorandum accounts under any circumstances. Per SP-27-W, balancing and memorandum accounts track the difference between actual and authorized amounts. Estimating account balances could lead AVR to recover for costs it has not yet incurred.

Re: Data Request No. ORA-A.14.04.002.ROY-001

Apple Valley Ranchos Water Company (AVR) submits the following responses to Data Request No. ORA-A.14-01-002.ROY-001 in reference to Apple Valley Ranchos Water Company General Rate Case No. A.14-01-002.

DATA REQUESTS

1. Please provide a complete list of all balancing and memorandum accounts currently authorized.

Response:
The balancing accounts and memorandum accounts currently authorized are listed below. Please note that the Incremental Cost Balancing Account is applicable only to AVR's Irrigation System.

Balancing Accounts
- Water Revenue Adjustment Mechanism/Modified Cost Balancing Account (W/RAM/MCBA)
- California Alternative Rates for Water (CARW) Balancing Account
- Office Remodel Balancing Account
• Employee and Retiree Healthcare Balancing Account
• Group Pension Balancing Account
• One-Way Conservation Expense Balancing Account

Memorandum Accounts
• Incremental Cost Balancing Account
• Military Family Relief Program Memorandum Account
• Outside Services Memorandum Account
• Conservation Proceeding Memorandum Account
• Conservation Expense (Best Management Practices – BMP) Memorandum Account
• Low-Income Customer Data Sharing Cost Memorandum Account
• Catastrophic Event Memorandum Account
• Interim Rates Memorandum Account
• Pressure Reducing Valve Memorandum Account
• 2010 Cost of Capital Memorandum Account
• 2013 Cost of Capital Memorandum Account

2. Please provide a list of balancing and memorandum accounts for which you are seeking recovery in this GRC.

Response:
The balancing accounts and memorandum accounts for which AVR is seeking recovery of in this GRC are the California Alternative Rates for Water (CARW) Revenue Reallocation Balancing Account, Conservation (Best Management Practice- BMP) Memorandum Account, and the Outside Services Memorandum Account.

There are a number of balancing and memorandum accounts that are effective throughout the current rate case cycle (2012 – 2014) and as such final balances cannot be determined at this time. These accounts include the Office Remodel Balancing Account, Employee and Retiree Healthcare Balancing Account, Group Pension Balancing Account, and One-Way Conservation Expense Balancing Account.

AVR proposes that the Commission authorize the filing of advice letters to request recovery/refund of the balances recorded in these accounts after the accounts are terminated (at the conclusion of the current rate case cycle) and final balances have been determined.

3. Please provide all work papers, all general ledger data, and all transaction data (source documents if possible) related to the balancing and memorandum accounts identified in Question 2.

Response:
Please see the attached workpapers for the CARW Revenue Reallocation Balancing Account, Conservation BMP Memorandum Account, and the Outside Services Memorandum Account.
4. Are any of the accounts kept as regulatory assets on the financial statements? If yes, identify which accounts by name.

**Response:**
AVR's financial statements reflect the balances for all of its current balancing accounts and memorandum accounts (regulatory assets or liabilities). The accounts kept as regulatory assets on the financial statements are listed in the above response to Item No. 1. There are no balances reflected on the financial statements for the Military Relief Program Memorandum Account, Low-Income Customer Data Sharing Cost Memorandum Account, Pressure Reducing Valve Memorandum Account, and Credit Card Memorandum Account because there has been no activity and therefore no balance for these accounts.

This completes the response to data request ROY-001. If you have any questions or require additional clarification or information, please contact me.

Sincerely,

APPLE VALLEY RANCHOS WATER COMPANY

Attachment
CDPH Submits Final Regulation Package
Regarding Hexavalent Chromium (Cr VI) and Drinking Water

SACRAMENTO - The California Department of Public Health (CDPH) today submitted to the Office of Administrative Law (OAL) its final proposed regulation establishing the first ever drinking water Maximum Contaminant Level (MCL) for hexavalent chromium (Cr VI). More than 15,000 comments were received by CDPH regarding the proposed regulation. The proposed final regulation documents include the Summary and Response to comments received.

The proposed final regulation will take effect after it has been reviewed and approved by OAL in compliance with the Administrative Procedures Act. This review can take up to 30 working days to complete. Once approved, the regulation is then filed with the Secretary of State and will become effective the first day of the following quarter.

“The drinking water standard for hexavalent chromium of 10 parts per billion will protect public health while taking into consideration economic and technical feasibility as required by law,” said Dr. Ron Chapman, CDPH director and state health officer.

If the regulation is approved as expected, implementation of the new drinking water standard for hexavalent chromium will begin July 1, 2014.

Today’s filing also complies with timelines imposed by the Alameda Superior Court in Natural Resources Defense Council, Inc. v. California Department of Public Health.

The department’s submission to OAL can be found on the CDPH website.

www.cdph.ca.gov
CHAPTER 15: SPECIAL REQUESTS

A. INTRODUCTION

This chapter presents ORA’s analysis and recommendations regarding the special requests made by AVR in its application. More specifically, AVR has requested the following:

1) Implement a tariff charge for fire-flow tests;
2) Increased tariff charge for restoration of service requests;
3) Implement a tariff charge for non-emergency, voluntary disconnection after-hours;
4) Offer a level payment plan option to customers;
5) Change the current interest rate on customer deposits under Rule No.7 from 7% per annum to the average monthly 90-day Commercial paper rate;
6) Recognize subsequent offsets prior to the issuance of a final decision in this GRC; and
7) Authorize a new rate adjustment mechanism, termed the Sales Reconciliation Mechanism (SRM) that would be applied if triggered during the escalation years of the general rate case period.

ORA closely evaluated these special requests for reasonableness in light of AVR’s history, for conformity with Commission requirements and precedent, and for anticipated ratemaking impact.

B. SUMMARY OF RECOMMENDATIONS

Based on ORA’s evaluation of AVR’s proposals, the special requests should be granted in part and denied in part.
15-2

TABLE 15-A: SUMMARY OF AVR’S SPECIAL REQUESTS AND ORA RECOMMENDATION

C. DISCUSSION

1) The Commission should grant AVR’s Special Request #1 to implement a tariff charge for fire-flow tests

AVR requests the Commission’s authorization for a tariff charge for fire-flow tests. AVR argues that only customers who request this service benefit from it, therefore, they should be required to pay the associated costs.\(^{223}\)

ORA agrees that it is consistent with the cost of service principle to charge only those customers who actually request this service. In response to ORA’s data request, AVR provided calculations for the cost of the service based on the 2015 projected payroll numbers and the historic average number of requested tests.\(^{224}\)

According to AVR, fire-flow tests are performed by employees in the Utility Serviceperson position and require one hour to complete on average. AVR projects an average hourly rate for the Utility Serviceperson position of $57.74.\(^{225}\)

\(^{223}\) A.14-01-002, AVR Revenue Requirements Report, Exhibit B, p. 145.

\(^{224}\) Response to Data Request JRE-002, Question 2.

\(^{225}\) Id., Question 2.
Based on a rounded average hourly payroll burden of $60 and an average of 10 tests performed per year, AVR anticipates collecting $600 per year in miscellaneous revenue. The $600 per year revenue collected from the tariff charge should be included in the revenue requirement, but excluded for rate design purposes. ORA recommends that the Commission grant AVR’s request for a customer tariff charge for this service.

2) The Commission should grant AVR’s Special Request #2 to increase the tariff charge for restoration of service with ORA’s recommended modifications

AVR requests Commission authorization to update the tariff charge for restoration of service during both working hours and after-hours. AVR requests an increase in fees for regular hour reconnections from $30 to $35, and an increase in after-hour reconnections from $60 to $200, based on the cost to provide the service. AVR’s proposed increase in the reconnection charges reflect an assumption of half an hour of regular labor for reconnections during working hours, and two hours of overtime labor for reconnections during after-hours. The average time required during after-hours (two hours) is an assumed value provided by AVR without justification in the application or workpapers for this GRC. ORA disagrees with the assumptions used to calculate the after-hours reconnection fee. In addition, ORA is concerned that a fee of $200.00 may be excessive and cost prohibitive for some customers to resume water service.

ORA agrees that these fees should ideally be based on the cost of service, but does not support the assumptions related to the two hours of work time required made by AVR in the calculation of $200.00 during after-hours. Therefore, ORA recommends a more modest increase of $100.00 during after-hours, which reflects the cost of one hour of overtime labor and is a 67% increase.

226 AVR Rule No. 11 C.3 Discontinuation of Service defines non-regular hours as after 4:30pm during weekdays and on weekends and holidays.
227 AVR Workpaper “AVR Miscellaneous Revenues.xlsx,” Hrly Rate Calc tab.
over the existing fee amount. The revenue collected from restoration of service should be included in the revenue requirement, but excluded for rate design purposes. Given the lack of supporting data, ORA recommends that AVR begin to track these services and costs and submit recorded info in the next GRC.

ORA recommends that the Commission grant AVR’s request for an updated customer tariff charge for this service with the modifications proposed by ORA set forth above.

3) **The Commission should deny AVR’s Special Request #3 to implement a tariff charge for voluntary disconnection after-hours**

AVR requests the Commission’s authorization for a tariff charge for non-emergency, voluntary disconnections after-hours. Again, AVR argues that only customers who request this service should be required to pay the associated costs.

AVR failed to provide evidence supporting the reasonableness of this request. AVR did not provide an explanation as to why a customer would request a voluntary disconnection after-hours, or any historical data on voluntary disconnections for which this charge would be applicable. Additionally, AVR did not provide proposed tariff language that specified what this service entails.

Furthermore, AVR did not include estimated revenue for charges for voluntary disconnections that it claimed would be equal to the cost of providing this service.

ORA asserts that approval of tariff charges for non-emergency, voluntary disconnections will harm customers as they will pay for these services, but the associated revenues will not be reflected in the general rates. Given the lack of supporting data, ORA recommends that AVR begin to track these services and costs and submit recorded info for reconsideration in the next GRC. For the purposes of this GRC, ORA recommends that the Commission deny the implementation of tariff charges for these services.

---

As part of the previous GRC, AVR reconnections fees were increased from $15 to $30 during regular hours and from $20 to $60 after-hours.
4) The Commission should deny AVR’s Special Request #4
to create a Level Payment Plan

AVR requests Commission authorization to offer a Level Payment Plan option to customers. This option would allow customers to pay for water service in equal bi-monthly payments based on their last 12 months average bill, or a representative bill if their consumption history is shorter than one year. At the end of a 12-month period, customers will receive a settlement bill with a payment due or a credit balance.\textsuperscript{229} Although the payment plan would assist low-income customers in paying their water bills, implementation may be challenging and the level bills throughout the year would interfere with the ability to send conservation pricing signals. It is unclear how the changed price signals resulting from more levelized payments will impact customers’ current conservation behaviors. There are more pragmatic challenges, however, including whether surcharges and taxes should be included in the bills that are “averaged” to develop the monthly levelized payments. This is particularly problematic in the case of surcharges like those for low-income assistance programs. If, due to a level payment plan, a customer sometimes pays more than their actual bill, and sometimes pays less, assumptions must be made about how to allocate the amounts actually charged for proper accountability. Therefore, for all the reasons discussed above, AVR’s request to offer a Level Payment Plan should be denied.

5) The Commission should grant AVR’s Special Request #5
to Change the Interest Rate Applied to Customer Deposits Under Tariff Rule No.7

AVR proposes to change the interest rate on customer deposits under tariff Rule No. 7 from 7% per annum to the average monthly 90-day commercial paper rate. These advanced deposits are required from customers with insufficient credit in order to obtain water service from AVR. After 12 consecutive months, AVR
returns these customer deposits with interest. AVR also returns the deposit and interest if a customer wishes to discontinue their service prior to the end of the 12-month period.\(^{230}\)

Given that AVR’s request has no impact on ratemaking, and that the 7% interest rate prescribed by tariff rule No.7 does not reflect current market conditions, ORA agrees with AVR and recommends that the 7% rate should be changed to the 90-day commercial paper rate.

6) The Commission should grant AVR’s proposal to recognize any subsequent offsets

AVR proposes that the Commission recognize any subsequent offsets that occur prior to the issuance of a final decision in this GRC. AVR’s request to reflect the offsettable expenses into the current GRC proceeding is consistent with Commission’s goal of streamlining the regulatory process, improving customer service and saving both AVR and Commission staff’s time and resources. Therefore, ORA agrees with AVR that the final decision should reflect offsettable expenses to the extent that they have been resolved and updated. However, ORA is concerned that the inclusion of offsettable expenses could potentially lead to the perception of higher revenue requirement than what AVR has requested in its application. ORA recommends AVR notify its customers explaining the resulting increase and the reason for the increase after the Commission’s final decision as a condition for the approval of this request.

7) The Commission should deny AVR’s Special Request #7 to implement a Sales Reconciliation Mechanism

In Special Request #7, AVR requests a new mechanism to adjust rates between general rate cases. Termed the sales reconciliation mechanism, the

\(^{230}\) AVR Rule No. 7.

requested deviation from the current ratemaking process would allow AVR to change customer base rates beyond what is currently permitted under the General RCP.

ORA is strongly opposed to this request and points out that the public interest is harmed when individual elements of comprehensive Commission decisions such as the RCP are eroded in a piecemeal fashion.

AVR’s proposal is based substantially on the SRM proposed by California Water Service Company (Cal Water) in its recent GRC Application, A. 12-07-007.\textsuperscript{231} The purpose of the SRM is to adjust the adopted sales forecast in the two escalation years following the test year if total sales for the prior year are more than 5% above or below the adopted test year sales. The SRM would provide an adjustment of 50% of the difference. For example, if sales are 6% below adopted, escalation year rates would be reset based upon a 3% downward adjustment in the sales forecast. Likewise, if sales were 6% above adopted, rates would be reset based on a 3% upward adjustment in the sales forecast.\textsuperscript{232}

\textbf{a) Conflict with the Rate Case Plan}

Pages A-19 through 20 of the Revised RCP for Class A Water Utilities detail the procedures that Class A water utilities must follow when estimating escalation-year sales to establish customer rates. In particular, escalation-year sales are calculated based upon the average customer growth and test-year sales per customer, which have been generally analyzed, tested for reasonableness, and authorized by Commission decision as part of the general rate case process.\textsuperscript{233}

As the inputs that form the basis for the escalation-year’s calculation of sales have been previously reviewed and authorized by Commission decision, the

\textsuperscript{231} Exhibit F – Testimony of David Morse, p. 4.
\textsuperscript{232} Exhibit F – Testimony of David Morse, pp. 3-4.
\textsuperscript{233} D.07-05-062, Opinion Adopting Revised Rate Case Plan for Class A Water Utilities.
annual escalation filings by Class A water utilities are typically designated as Tier I, which require no additional customer notice and permit rate changes to become effective pending disposition.\(^\text{234}\)

According to AVR, the proposed SRM would incorporate sales reconciliation into the Commission’s process for escalation increases and eliminate the need for an additional informal filing. However, unlike the current escalation year filing where many of the inputs to the calculation have been known and reviewed, the SRM would allow calculations that have not been reviewed or examined for accuracy by ORA staff to immediately impact customer rates through the same automatic and ministerial process.

b) The Commission should require greater utility accountability for customer rate changes – not less.

Concerns regarding transparency and customer notification when general rates can be adjusted outside of a general rate case proceeding are relevant when considering yet another mechanism to automatically adjust customer rates. Just as customers deserve to know the rates they will be asked to pay, the Commission deserves to know the total and cumulative impacts of rates it is being asked to authorize. When customers’ general rates are allowed to change increasingly more outside of the general rate case process through numerous ratemaking vehicles, both the Commission and customers are seriously disadvantaged in knowing the actual and cumulative rate impacts that will result. Addition of yet another mechanism, particularly the SRM, is not warranted at this time.

The issue of a SRM is currently being litigated in the Cal Water GRC (A.12-07-007). The Commission has not yet issued a decision in the Cal Water proceeding, but we anticipate guidance will be available from the Commission before hearings or briefs in this AVR case.

\(^{234}\) Water Industry Rule 7.3, Commission General Order 96-B.
D. CONCLUSION

ORA thoroughly evaluated AVR’s proposed special requests and has presented detailed analysis in light of the utility’s records and Commission requirements and precedent. The Commission should adopt ORA’s recommendations.
CHAPTER 16: RATE DESIGN

A. INTRODUCTION

This chapter presents ORA’s analysis and recommendations on AVR’s proposed rate design. AVR requests authorization to continue the conservation rate design program with modifications to the tier breakpoints and tier price differentials.

B. SUMMARY OF RECOMMENDATIONS

ORA reviewed AVR’s current conservation rate design and the proposed modifications to the tier breakpoints and price differential between tiers. ORA recommends the Commission adopt AVR’s conservation rate design for residential and non-residential customers as described in this chapter.

C. DISCUSSION

AVR proposes to continue its existing conservation rate design program. The proposed rate design is a continuation of the program adopted by D.08-09-026 and authorized in D.12-09-004.

AVR currently provides service under the following tariff schedules:

<table>

</tbody>
</table>

1) Residential Service Rate Design

AVR’s proposed rate design for residential customers would continue the conservation rate design program with some adjustments, which are discussed in the following sections.
a) Present Rate Design

The current program includes increasing block rates in three tiers, which charge higher volumetric rates for increased water usage. The tier breakpoints are based on AVR’s consumption patterns and seasonality. The consumption range for Tier 1 is designed to capture indoor water use and is intended to include residential customers with low to average consumption. The consumption range for Tier 2 increases to the mid-point between the average monthly annual consumption and the average monthly summer consumption. All consumption over Tier 2 is considered Tier 3.

In the present rate design, Tier 1 includes consumption up to and including the first 13 ccf (hundred cubic feet) per month at the volumetric rate of $2.478 per ccf. Tier 2 includes all usage over 13 ccf through 26 ccf per month at the volumetric rate of $2.788 per ccf. Tier 3 includes all usage over 26 ccf per month at the volumetric rate of $3.098 per ccf. Since AVR bills residential customers on a bi-monthly basis, twice the monthly values are used as the tier breakpoints as presented on customer bills (Tier 1 includes the first 26 ccf, Tier 2 includes usage over 26 ccf through 52 ccf, and Tier 3 includes usage over 52 ccf.)

AVR’s present rate pricing structure is designed to recover 70% of revenue from the quantity charge. The CUWCC’s BMP 1.4 sets the threshold of a rate structure being conservation oriented if more than 70% of revenue comes from the quantity charge. Prior to conservation rate design, implemented by AVR in 2009, a larger portion of revenue was recovered in the service charge.

b) Proposed Rate Design

The proposed rate design adjusts the consumption breakpoint between Tier 1 and Tier 2 and between Tier 2 and Tier 3, and increases the price differential between the volumetric rates.

AVR used a 2012 bill tabulation analysis, that is the total amount of water usage that was billed at any usage level or tier, to determine the forecasted water usage.
use by tier. As in the previous GRC, Tier 1 includes consumption up to the midpoint between the median and the average winter consumption (the proxy for indoor water use). The consumption range for the second Tier extends to the midpoint between the average monthly consumption and the average summer consumption. All consumption over Tier 2 is considered Tier 3. Using this more current data from the 2012 bill tabulation analysis, AVR proposes that the breakpoint between Tier 1 and Tier 2 shifts from 13 ccf to 12 ccf per month and the breakpoint between Tier 2 and Tier 3 shifts from 26 ccf to 21 ccf per month.\footnote{AVR spreadsheet “AVR Blocks 15-Residential” provided in Tiffany Thong email dated April 25, 2014}

AVR also proposes to change the volumetric price differential between the tiered rates from 10 percent to 12 percent. In the previous rate case, the differential between tiers was increased from 5 percent to 10 percent. AVR’s proposed change in this case is a continuation of the gradual increase in volumetric price differential to encourage customers to adopt conservation measures. The quantity rates for these tiers are set with a differential of 12 percent, so that the quantity rate for the Tier 1 is 76% of the quantity rate for Tier 3. The quantity rate for Tier 2 is 88% of the quantity rate for Tier 3. Tier 3 is calculated by dividing the revenue from total estimated consumption at the commodity rate by the consumption in the first and second tiers.\footnote{AVR Workpaper “AVR Rev 2015r,” Future Rates tab.} The proposed volumetric rate for Tier 1 is $2.921 per ccf, for Tier 2 is $3.382 per ccf, and for Tier 3 is $3.843 per ccf.

ORA’s Table 16-A below presents AVR’s current rate design and rates, as presented in AVR’s tariff sheets, and compares them to AVR’s proposed rate design and rates as presented in Appendix B of AVR’s Revenue Requirement Report.\footnote{ORA uses AVR’s proposed rates for the purposes of illustration in this rate design chapter. However, ORA’s use of AVR’s proposed rates should not be interpreted to mean that ORA}

<td>12%</td>
</tr>
</tbody>
</table>

ORA opposes AVR’s proposed rates illustrated in Table 16-A above, because as presented elsewhere it this report, ORA recommends a lower revenue requirement in this general rate case. However, ORA supports AVR’s rate design methodology used to determine the new tier breakpoints and price differential between tiers. ORA recommends that the Commission adopt AVR’s proposed conservation rate design methodology for residential customers for use in developing the Test Year 2015 residential service rates for this GRC.

ORA’s Review of the Impact on Customer Bills by AVR’s Proposed Rate Design

ORA’s Table 16-B below demonstrates the amount and percent increase for residential 5/8-inch meter bi-monthly bills for various quantities of water (10 through 100 ccf). This table includes the volume of 32.68 ccf per bi-monthly bill,

(continued from previous page)

agrees with AVR’s proposed rates. Because of ORA’s recommendations in this Report that result in a lower revenue requirement, the actual rates adopted by the Commission will likely be lower than those proposed by AVR. As with past GRCs, ORA does not determine the specific rates associated with its proposed operating revenue. AVR’s proposed rates represent the highest possible rates and the highest possible bill impacts for this GRC.
which corresponds to AVR’s proposed average consumption of 196.07 ccf per customer per year in Test Year 2015.

</tr>
</tbody>
</table>

Table 16-B above shows that AVR’s proposed conservation rate design results in a rate increase to all customers, but the highest rate increases will be to high-use customers. This creates an incentive for customers to use less water. Water conservation is consistent with state goals and should lower all customers’ costs in the long-term by lowering operation and production costs and deferring or avoiding infrastructure investment. As stated above, ORA opposes AVR’s proposed rate increases but supports AVR’s rate design methodology.

2) Non-Residential and Gravity Irrigation Service Rate Design

a) Non-residential Service

AVR proposes to continue the use of a single quantity rate for AVR’s non-residential customers. Due to significant variations of usage throughout these customer classes, developing increasing block rates would likely require reclassification of these customers.
AVR’s proposed non-residential rate design calculates 70% of revenue will come from the quantity rates and 30% will come from service charges. AVR’s proposed non-residential customer service charges are based on customer meter sizes and are equal to those determined in the residential customer class rate design.

Fire service does not have a quantity charge, and AVR proposes to increase the fixed service charge by the percent increase in total operating revenue.

The Public Authority – Irrigation customer class includes irrigation water sold to the Town of Apple Valley for its James Woody Park which has a discounted commodity rate approved by the Commission in Resolution W-4499. In this GRC, the discounted rate is adjusted using forecasted consumption to determine the charge required to create an overall rate increase equal to the system average percent increase. The same adjustment is proposed for the discounted rate for the Town’s irrigation water used at the Apple Valley Country Club.

Although ORA does not agree with AVR’s proposed rates, ORA agrees with AVR’s rate design methodology and finds the proposed non-residential rate design to be reasonable. Thus, ORA recommends that the Commission adopt AVR’s proposed rate design methodology for use to determine rates for this rate case cycle.

b) Gravity Irrigation Service

AVR’s proposed Gravity Irrigation service charge for Jess Ranch Golf Course (the single customer in this customer class), is based on the customer’s meter size and is equal to that determined in the residential customer class rate design. AVR’s proposed volumetric charge is based on a cost of service study that was performed by AVR in this rate case. This practice for the gravity irrigation customer class has been used for the last three rate case cycles and is important to

---

238 AVR Workpaper “Irr Expense 2-15r.xlsx”
ensure that this single customer is not subsidized by any other customers. AVR should continue to submit updated cost of service data in future GRCs.

D. CONCLUSION

ORA recommends that the Commission adopt AVR’s proposed conservation rate design methodology for residential and non-residential customers for use in the Test Year 2015 rate case cycle. ORA should continue to provide revised data regarding the gravity irrigation cost of service.
CHAPTER 17: WATER QUALITY

A. INTRODUCTION

This Chapter presents ORA’s analysis and recommendations on water quality for Apple Valley Ranchos Water Company (“AVR”). AVR operates a water system under a permit from the California Department of Public Health (“CDPH”). AVR’s main water supply comes from twenty one (21) groundwater wells, which ORA water from the deep Alto subunit of the Mojave Groundwater Basin. AVR describes the quality of its source of supply as “high quality,” due to the fact that the aquifer is recharged from snowmelt from the nearby mountains and water from the California State Water project spread in the Mojave River. Currently, AVR disinfects the water with chlorine prior to distributing it to customers.

Investor owned water utilities are required to submit information about water quality as part of each utility’s General Rate Case (“GRC”) application. In accordance with these requirements, AVR submitted water quality information in its Minimum Data Requirements (“MDR”). In developing its recommendation for water quality, ORA reviewed AVR’s testimony, application, work papers, and the most recent CDPH inspection report available for AVR’s water system. ORA also contacted CDPH representatives for the agency’s appraisal of AVR’s water system.

B. SUMMARY OF RECOMMENDATIONS

Based upon the information provided by AVR and CDPH, it appears that AVR’s water system is currently in compliance with CDPH water quality regulations, all applicable federal drinking water requirements, and General Order 103-A.
C. DISCUSSION

Between 2011 and 2013, CDPH did not issue any citation to AVR for exceeding the maximum contaminant level (“MCL”). The most recent CDPH inspection report available for AVR’s water system is dated September 29, 2008.\textsuperscript{239} CDPH recently conducted an inspection of the water system, but has not finalized its report. CDPH indicated that the system is well maintained and did not observe any major deficiencies during the inspection of wells, reservoirs, and other components. AVR is in compliance with all water quality monitoring requirements.\textsuperscript{240} On April 15, 2014, CDPH finalized its proposed regulation of chromium 6 at 10 parts per billion (“ppb”). Although 16 of AVR’s wells contain detectable concentrations of chromium 6, none are above CDPH’s proposed standard of 10 ppb.

D. CONCLUSION

Based upon the information provided by AVR and CDPH, AVR’s water system appears to have been and continues to be in compliance with federal and state drinking water standards between 2011 and 2013. Therefore, ORA recommends that the Commission find that AVR is in compliance with all applicable federal and state drinking water standards, including GO-103A.

\textsuperscript{239} Minimum Data Requirement, Response #G6.
\textsuperscript{240} Email from Brenda Pauli of CDPH, dated April 3, 2014.
CHAPTER 18: CALIFORNIA ALTERNATIVE RATES
FOR WATER BALANCING ACCOUNT

A. INTRODUCTION

This chapter addresses the recovery of under collected balances in AVR’s CARW Balancing Account as well as AVR’s proposal to increase the flat-rate discount provided to CARW qualifying customers. ORA recommends recovery of the under-collected balance of $425,758 through a temporary surcharge. ORA does not oppose AVR’s proposed increase in discount provided, however it is recommended AVR investigate alternate discount methods and present findings in the next GRC.

CARW helps make water more affordable to low-income customers. To reduce their total water bill, qualifying low-income customers currently receive a flat-rate discount while non-qualifying customers fund the program through a flat-rate surcharge. A balancing account was established in D.05-12-020 to minimize the effects of over-collection or under-collections of the program.

To qualify for a discount, AVR’s residential customers with a service connection of one-inch or less must self-certify their household earnings are below certain threshold amounts depending on household size. AVR’s threshold amounts are as follows:

<table>
<thead>
<tr>
<th>Number of Persons in Household</th>
<th>Total Combined Yearly Income</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>$22,980</td>
</tr>
<tr>
<td>2</td>
<td>$31,020</td>
</tr>
<tr>
<td>3</td>
<td>$39,060</td>
</tr>
<tr>
<td>4</td>
<td>$47,100</td>
</tr>
<tr>
<td>5</td>
<td>$55,140</td>
</tr>
<tr>
<td>6</td>
<td>$63,180</td>
</tr>
<tr>
<td>7</td>
<td>$71,220</td>
</tr>
<tr>
<td>8</td>
<td>$79,260</td>
</tr>
</tbody>
</table>

Add $8,040 for each additional person

Under AVR’s self-certification process, customers complete and submit a form to AVR to participate in the low income program. Customers who already participate in an
energy utility low income program are automatically enrolled in AVR’s low income
program through a data sharing arrangement with energy utilities that have overlapping
service areas with AVR. While AVR’s website indicates it may request verification
information from customers, AVR does not actually have a verification mechanism in
place that accompanies its enrollment process. Moreover, AVR does not have a
verification mechanism to support its procedure of verifying customer eligibility once
every two years.

Data-sharing with other utilities was authorized in D.11-05-020 to make it easier
for low-income customers to be identified and given a discount. CARW program
participation has increased dramatically since the implementation of data sharing; AVR
had less than 2,000 low-income customers before data sharing implementation. As of
December 2013, AVR had 5,088 low-income customers, which represent 26% of
AVR’s total customers.

B. SUMMARY OF RECOMMENDATIONS

ORA recommends that AVR recover the under-collected balances in the CARW
account through year-end 2013 in the amount of $425,758 via a 12-month temporary
surcharge. ORA does not oppose AVR’s methodology in increasing the amount of
discount provided to CARW qualifying customers in this GRC. However, ORA
recommends AVR investigate using a percentage based discount and provide its findings
and recommendations in the next GRC.

C. DISCUSSION

1) Recovery of Under-Collected Balances

AVR requests the Commission approve recovery of the under collected-balance of
the CARW balancing account for the amount of $425,758. The amounts in the account

---

242 From Electronic File - AVR NumCusts_AVR 2013.xlsx; Total number of customers is 19,545.
were last authorized for recovery through advice letter 176-W for balances through
December 10, 2010. ORA recommends that AVR recover the under-collected balances
of $425,758 for the period December 10, 2012 to December 31, 2013.

2) Examination Scope and Objectives
ORA examination scope and objectives include verifying the requested recovery
amount including interest and determining the eligibility of recovery.

3) Examination Procedures and Results
ORA examination procedures included reading applicable decisions and advice
letters, verifying tariffs, determining whether commercial customers are included,
determining the number of customers and qualifying customers, determining the amounts
of discount or surcharge billed to customers, determining the beginning and ending
account balances, sampling bills, and determining if the surcharge from previous
balances is applied to qualifying customers. Costs tracked in AVR’s CARW Balancing
Account appeared to be reasonable through year-end 2013. ORA sampled customer
billing data for the year of 2013. The sample did not show anything out of the ordinary.
Since there were no extraneous or unauthorized amounts in the account, ORA
recommends recovery of the under-collected amount of $425,758 through a 12-month
temporary surcharge.

4) Increasing CARW Discounts
a) AVR’s Proposed Increases in Discount.
AVR proposes to increase the amount of its flat rate discount provided by the
“overall percentage rate increase authorized by the Commission.” AVR has proposed
rate increases of 14.88%, 8.48%, and 8.19% for years 2015, 2016 and 2017, respectively,
for an overall rate increase of 31.55%. If the currently authorized CARW discount of
$6.69 increases by 31.55%, the result is $8.80. AVR states it wants to increase the flat
rate discount by the actual authorized rates, therefore, the numbers provided in its application are not exact figures. Calculating the corresponding surcharge needed to ensure there is no over-collection or under-collections in the account would increase the surcharge collected from all customers from $0.55 to $2.86 per customer bill in order to adequately fund the low income discount program.

The proposed discount of $8.80 would represent an equivalent discount of 11.88% of AVR’s proposed average residential customer bill in 2015. ORA does not oppose AVR’s proposed method to increase its flat-rate discount to CARW customers in this GRC.

ORA notes that other Class-A water utilities either currently have or are proposing different methods to develop the discount provided to qualifying customers. For example, California-American Water Company is proposing a 20% discount to low income customer bills instead of a flat-rate discount, and California Water Service Company has a 50% discount to monthly service charge (up to a capped amount.) ORA recommends that AVR investigate using a percentage based method and provide its analysis and recommendations in the next GRC application. A percentage based method could eliminate the need to reset the discount amount to reflect changes in authorized rates.

b) Calculating Surcharge

Funding the program will be a matter of forecasting water usage rates and applying the discounts above to low-income customers. ORA recommends that AVR use the same method for determining the amount of surcharge needed to fund the program as it has done in the past. AVR should estimate the total amount of funding needed and apply it to the number of non-qualifying customers on a monthly basis.

243 Response to DR ROY-005 Question 1.
244 For 5/8” x ¾” meter with 33 ccf per billing cycle.
245 A.13-07-002, Direct Testimony of David Stephenson of Cal-Am and Direct Testimony of Daphne (continued on next page)
D. CONCLUSION

ORA finds that previous unrecovered amounts in AVR’s CARW Balancing Account are reasonable and recommends that the Commission allow AVR to recover the $425,758 account balance as of year-end 2013 through a 12-month temporary surcharge. ORA does not oppose AVR’s methodology in increasing the amount of discount provided to CARW qualifying customers in this GRC. However, ORA recommends AVR investigate using a percentage based discount and provide its findings and recommendations in the next GRC.

The amount of surcharge should be based on the amount of estimated discount to be provided to qualifying customers and then applied to estimated amounts of non-qualifying customers so that, ideally, the balancing account will have a zero balance at the end of each period.

(continued from previous page)
Korthamar of ORA.
CHAPTER 19: WATER REVENUE ADJUSTMENT
MECHANISM/MODIFIED COST BALANCING ACCOUNT

A. INTRODUCTION

AVR makes the following requests regarding changes to its Water Revenue Adjustment Mechanism/Modified Cost Balancing Account (WRAM/MCBA) revenue decoupling mechanism:

1) Add the commodity revenues for the irrigation-gravity customer group to the WRAM balancing account and add the irrigation-gravity production costs to the MCBA;

2) On the effective date of tracking irrigation-gravity water costs in the MCBA, the current Incremental Cost Balancing Account for irrigation-gravity would terminate;

3) Additionally, AVR requests to add the cost of chemicals to the supply costs captured by the MCBA.246

B. SUMMARY OF RECOMMENDATIONS

1) Commodity revenues and production costs for the irrigation-gravity customer, a single golf course, should not be tracked in the WRAM/MCBA because it will not further the State’s water conservation goals, fluctuations in price are already tracked in the Incremental Cost Balancing Account, and the gravity-irrigation system is in a unique situation that leads to high unaccounted for water (estimated by AVR at 79.6%) so it is not fair for other customers to pay for increases or reductions in commodity costs due to the gravity irrigation golf course.

246 AVR Application Exhibit B, P. 133-134.
2) Because ORA recommends not tracking irrigation-gravity commodity costs in the MCBA, it is unnecessary to terminate the current Incremental Cost Balancing Account.

3) Cost of chemicals should not be added to the supply costs captured by the MCBA because these costs are within AVR’s control and with full-cost balancing account treatment AVR would no longer have the proper incentive to reduce costs, which could unnecessarily lead to additional costs for ratepayers. This approach is consistent with the MCBA principles outlined in the Water Action Plan and authorized by the Commission for Park and CalWater in D.08-02-036 in Phase 1A of the Conservation OII (I.07-01-022) and for AVR in D.08-09-026.247

C. DISCUSSION

1) Commodity revenues and production costs for irrigation-gravity should not be tracked in the WRAM/MCBA

The production costs included in AVR’s MCBA are purchased power, replenishment, and leased water rights.248 For the irrigation-gravity customer (a single golf course), there is no leased water rights costs because of AVR’s water supply agreement that allows AVR to pump the water for free (except for purchased power and replenishment fees).249 Thus, the only commodity costs that would be included in the MCBA under AVR’s proposal are purchased power and replenishment fees.

---

247 D.08-02-036, p. 26 and D.08-09-026, Attachment A – Settlement Agreement, p. 36.
248 AVR Application Exhibit B, P. 133-134.
249 Park acquired the stock of Jess Ranch Utilities Inc. in 1994 and the resulting water supply contract grants to “Jess Ranch Utilities Inc., at no cost, the right to pump and take from wells within the Jess Ranch development sufficient water to supply the domestic customers in the Jess Ranch Development, up to 2500 A.F., and sufficient water to meet the irrigation needs of the golf course and greenbelt areas of the Jess Ranch Development, up to 1500 A.F.” . . . “the water supply agreement also provides sufficient water rights for the Jess Ranch Irrigation System at no cost (except for purchased power and replenishment fees).” Exhibit B, pp. 42-43.
AVR forecasts $95,626 in Test Year 2015 for electric commodity charges for the irrigation-gravity customer.\(^{250}\) This is higher than the recorded years of electric commodity charges of $76,012 in 2010, $76,000 in 2011, and $61,128 in 2012, and $70,683 in 2013. Thus, AVR is not anticipating reductions in purchased power commodity charges in Test Year 2015 relative to recent years, despite anticipating reductions in usage for the golf course irrigation-gravity customer. There is no compelling argument that full-cost rather than incremental-cost balancing account treatment for purchased power and replenishment fees associated with the irrigation-gravity golf course will further the State’s water conservation goals. There is little fluctuation in the costs in the purchased power account from year to year, and the fluctuations due to price are already tracked in an Incremental Cost Balancing Account. Replenishment fees are less than $10,000 per year under AVR’s forecast and it is unnecessary to track variations in this amount in the MCBA balancing account.

If reductions in purchased power did occur in Test Year 2015 relative to the costs ultimately adopted in this GRC for the irrigation-gravity customer, those would be tracked in the WRAM/MCBA under AVR’s proposal.

There are a number of reasons it does not make sense to track these costs in the WRAM/MCBA. The WRAM/MCBA surcharges/surcredits are paid for or credited to all AVR’s customers and it is not fair for the rest of the customers, other than the gravity irrigation golf course, to pay for reductions or increases in purchased power costs due to the gravity irrigation customer. The gravity irrigation golf course is in a unique situation involving a longstanding legal agreement that leads AVR to have very high unaccounted for water of 79.6% under AVR’s estimate.\(^{251}\) Furthermore, the amount of water pumped into the irrigation system is out of AVR’s control.\(^{252}\) Since the amount of water pumped is outside of AVR’s control, providing full cost-recovery of any amount of purchased

\(^{250}\) AVR Workpaper “Irr Expense 2015r.xlsx,” see “ExpenseDetail” tab.

\(^{251}\) AVR Application Exhibit B, pp. 42-43.

\(^{252}\) AVR Application Exhibit B, p. 45.
power needed for the water in this system will not improve AVR’s incentives to reduce
the water pumped and the associated purchased power. Thus, AVR’s proposal does not
further the state’s goals for water or energy conservation/efficiency. Rather, it will
simply benefit AVR by ensuring full cost recovery for an amount of purchased power
that is needed to supply one golf course customer. Continuing the incremental cost
balancing account for purchased power is the most appropriate course of action.

2) Incremental Cost Balancing Account Should Continue

Because ORA recommends not tracking irrigation-gravity commodity costs in the
MCBA, it is unnecessary to terminate the current Incremental Cost Balancing Account.
The Incremental Cost Balancing Account “[t]racks differences in the water production
costs (purchased power, pump taxes) authorized in rates and the actual water production
costs (purchased power, pump taxes) incurred by the utility” and has a current estimated
balance of $3,095. ORA addresses the recorded balance in this account in ORA’s
testimony of Roy Keowen.

3) Chemical Costs Should Not Be Included in the MCBA

AVR argues that all production related costs, including chemical costs, should be
reflected in the MCBA to avoid potential for unintended incentives or disincentives to
AVR and customers. AVR states further that with all production costs included, the
MCBA will serve to refund all production cost savings due to lower than adopted sales,
or whenever actual production costs are lower than the forecasted costs included in rates,
back to customers.

AVR forecasts $21,954 in Test Year 2015 for chemicals for the domestic
system. Balancing account treatment for this de minimis category is unnecessary and
creates greater administrative burden for the Commission than any benefits to customers

---

253 AVR’s Response to ORA Data Request ROY-003 Question 1.
254 AVR Application Exhibit B, pp. 133-134.
255 AVR Workpaper “AVR Expenses 2015r.xlsx,” see “SME 2015” tab.
or AVR. $21,954 is only 0.092% of AVR’s proposed revenue requirement.²⁵⁶ Whereas, balancing accounts are only amortized when the balance exceeds 2% of the revenue requirement.²⁵⁷ Tracking the cost of chemicals in a balancing account is unlikely to ever lead to a material balance for amortization. This is further illustrated because the recorded amounts in this category do not vary greatly from year to year: $29,659 for 2008, $25,306 for 2009, $17,161 for 2010, $16,472 for 2011, and $21,420 for 2012.²⁵⁸

Additionally, there could be harm to customers in authorizing this request because chemical costs are under the control of AVR. AVR makes decisions about which chemicals to purchase, and which suppliers to purchase from. With full cost recovery for chemical costs through the MCBA, AVR would no longer have the proper incentive to reduce chemical costs, which could unnecessarily lead to additional costs for ratepayers. In this regard, the chemical cost category is different than the other production cost categories tracked in the WRAM/MCBA – purchased power, replenishment and leased water rights – where the unit cost for these items is outside of AVR’s control.

4) Five Options related to WRAM/MCBA in Decision 12-04-048

D.12-04-048 ordered AVR and other utilities to review the WRAM and MCBA mechanisms in subsequent general rate cases and to provide testimony to address five possible alternatives to the current operation of full revenue decoupling programs. The five options identified in D.12-04-048 are:

- Option 1: Should the Commission adopt a Monterey-style WRAM rather than the existing full WRAM?

- Option 2: Should the Commission adopt a mechanism that bands the level of recovery, or refund, of account balances based on the relative size of the account balance.

²⁵⁶ Proposed revenue requirement is $23,881,184 per AVR Workpaper “AVR Expenses 2015r.xlsx,” see “SME 2015” tab.
²⁵⁸ AVR Workpaper “AVR Expenses 2015r.xlsx,” see “ExpenseDetail” tab.
• Option 3: Should the Commission place WRAM/MCBA surcharges only on higher tiered volumes of usage, thereby benefiting customers who have usage only in Tier 1 or have reduced their usage in the higher tier levels?

• Option 4: Should the Commission eliminate the WRAM mechanism?

• Option 5: Should the Commission move all customer classes to increasing block rate design and extend the WRAM/MCBA mechanisms to these classes?

AVR addresses its compliance with D.12-04-048 and concluded that the Commission should not adopt any of the five options outlined in D 12-04-048. AVR also stated: “Also, there is not a long history of data to measure the impact of conservation changes such as tiered rates and conservation programs. For example, data for residential consumption by tier is only available from 2009 through 2012”.

ORA reviews AVR’s WRAM and MCBA balances submitted to DWA in 2010, 2011 and 2012 and the balances are shown below.

</tbody>
</table>

Based on AVR’s testimony and WRAMs/MCBAs balances, ORA’s observations are summarized as below.

5) Are the WRAMs/MCBAs achieving their stated purpose?

a) It is difficult to determine whether WRAMs/MCBAs have achieved their stated purpose at this time with only one rate case cycle of data available.

b) Since the WRAMs/MCBAs were implemented, the MCBA balance has decreased from 2011 to 2012.

---

259 Testimony of David Morse on Compliance with D.12-04-048 to Review Five Options, p. 18.

260 Testimony of David Morse on Request for a Sales Reconciliation Mechanism, p. 3.
c) Actual quantity revenues have been lower than adopted quantity revenues since the WRAMs were implemented, resulting WRAM under collections during 2010, 2011 and 2012.

d) It is unclear what roles (such as weather, the economy, drought declarations and community involvement in conservation) have played in AVR’s declining water sales.

e) ORA reviewed WRAM/MCBA balances for 2010 to 2012. On May 6, 2014, AVR filed its Advice Letter (AL) 190 requesting authorization to recover a total under-collection of $2,880,714 or 12.33% of its 2014 adopted revenue requirements.

6) Have the WRAMs/MCBAs removed disincentives to implement conservation rates and conservation program?

a) It appears that the WRAMs/MCBAs have generally removed disincentives for AVR to implement conservation rates and conservation programs by severing the relationship between sales and revenues.

b) AVR implemented conservation rates in October 2009, and this rate structure has been in place for approximately 4 years.

c) AVR has implemented various conservation programs as well as customer outreach initiatives between 2009 and 2013.

d) AVR has met or exceeded its 20/2020 goals.

e) It is apparent that any disincentives AVR may have had with respect to implementing conservation rates have been removed. However, the exact role that the WRAMs/MCBAs have played in removing such disincentives is not known.

7) Have cost savings resulting from conservation been passed onto ratepayers?

a) Since the implementation of WRAMs/MCBAs, AVR has requested the amortization of its net 2010, 2011, 2012 and 2013 WRAM/MCBA balances by filing four advice letters.

b) The MCBA balances reported in 2010 to 2012 are all over collections.
c) Since the MCBA balances are netted against the WRAM, the MCBA over collections associated with purchased, purchased power and pump taxes are passed onto AVR’s ratepayers.

d) ORA has not observed any cost savings associated with deferred infrastructure investment as a result of lower water demand.

Based upon the continuing necessity for refinement of WRAM/MCBA calculations, the limited period for which these mechanisms have been operating and the lack of adequate understanding regarding the environment in which the mechanisms operate with the water industry, ORA concludes that there are not adequate data at this time to address the five options the Commission has identified in D.12-04-048.

However, one obvious effect ORA believes attribute directly to the implementation of the WRAM/MCBA mechanism is the level of conservation it has been able to achieve. Thus, ORA believes the Commission should not abandon AVR’s current pilot project as the need to conserve is even more urgent given the drought state of emergency declared by the Governor and 2013-2014 being one of the driest year in recorded state history. And, neither should the Commission dismiss the alternatives that were identified in D. 12-04-048 as it may be necessary to re-formulate the WRAM/MCBA mechanism once more information on the working of WRAM/MCBA becomes available. Therefore, ORA recommends the Commission should reaffirm both the pilot project status of AVR’s decoupling program and the requirement to consider alternatives to decoupling in future GRCs or industry wide proceeding such as an OII.

D. CONCLUSION

ORA urges the Commission to continue Incremental Cost Balancing Account treatment for the irrigation-gravity customer’s commodity costs and to continue to exclude chemical costs from the MCBA since these costs are within AVR’s control.

APPENDIX B

QUALIFICATIONS AND PREPARED TESTIMONY
QUALIFICATIONS AND PREPARED TESTIMONY

OF

YOKE CHAN

Q.1. Please state your name, business address, and position with the California Public Utilities Commission (Commission).
A1. My name is Yoke W. Chan and my business address is 505 Van Ness Avenue, San Francisco, California. I am a Senior Utilities Engineer in the Water Branch of the Office of Ratepayer Advocates.

Q.2. Please summarize your education background.
A2. I graduated from the University of California at Los Angeles, with a Bachelor of Science Degree in Civil Engineering. I am a registered civil engineer in the State of California.

Q.3. Briefly describe your professional experience.
A3. I have been employed by the Commission for many years and have testified and worked on many general rate case proceedings, offset rate cases, transfer and compliance matters of Class A water utilities. I have also worked on ECAC proceedings for the energy utilities.

Q.4. What is your responsibility in this proceeding?
A4. I am the Project Coordinator for this proceeding and responsible for Chapters 1, 15 and 19.

Q.5. Does this conclude your prepared direct testimony?
A5. Yes, it does.
QUALIFICATIONS AND PREPARED TESTIMONY
OF
JENNY AU

Q.1. Please state your name, business address, and position with the California Public Utilities Commission (Commission).

A1. My name is Jenny M. Au and my business address is 320 West 4th Street, Suite 500, Los Angeles, California. I am a Utilities Engineer in the Water Branch of the Office of Ratepayer Advocates.

Q2. Please summarize your education background.

A2. I graduated from Cal Poly Pomona with a Bachelor of Science Degree in Civil Engineering. I am a registered civil engineer in the State of California.

Q3. Briefly describe your professional experience.

A3. I have been employed by the California Public Utilities Commission since April 2007 and participated in many GRCs. I prepared testimonies on Capital Projects, Sales Forecasting, and Water Quality in various Class A water utilities GRCs including Suburban, Golden States, Great Oaks, San Gabriel, Apple Valley Rancho, San Jose, and Cal Water.

From December 2006 through March 2007, I was a Hazardous Substance Engineer at the Department of Toxic Substances Control’s School Program. The School Program assists school districts in the assessment of environmental conditions at school properties. As a project manager, I oversaw the assessment, investigation, and cleanup of proposed school sites to certify that the sites are safe for the students and teachers who will attend the schools.

From January 1993 through November 2006, I was a Water Resource Control Engineer at the Los Angeles Regional Water Control Board’s Site Cleanup Unit. The Site Cleanup Program staff oversees the site investigation and corrective action at contaminated sites. I managed over 100 complex soil and groundwater cleanup projects involving a multiple of contaminants such as petroleum hydrocarbons, volatile organic compounds (PCE, TCE, etc.), emerging chemicals (perchlorate, 1,4 dioxane, chromium VI), and inorganics (metals, nitrate). My projects ranged from small industrial sites (e.g. dry cleaners) to multi-acre Department of Defense (DOD) sites. I reviewed and provided comments on site assessment and remediation plans and reports to ensure that the extent of soil and groundwater contamination is adequately defined and properly remediated to
levels which do not pose a risk to human health and the environment. I also
prepared NPDES permits and Waste Discharge Requirements for cleanup projects.

Q4. What is your responsibility in this proceeding?
A4. I am responsible for Chapters 8, 14 and 17.

Q5. Does this conclude your prepared direct testimony?
A5. Yes it does.
QUALIFICATIONS AND PREPARED TESTIMONY
OF
JOSE CABRERA

Q.1 Please state your name and address.
A.1 My name is Jose R. Cabrera. My business address is 505 Van Ness Avenue, 3rd floor, San Francisco, California 94102.

Q.2 By whom are you employed and in what capacity?
A.2 I am employed by the California Public Utilities Commission as a Public Utilities Regulatory Analyst V in the Office of Ratepayer Advocates’ Water Branch.

Q.3 Please briefly describe your educational background and work experience.
A.3 I am a graduate of California State University, Sacramento, with a Bachelor of Science Degree in Accounting. I also hold a Master of Science Degree in Taxation from Golden Gate University, San Francisco. Prior to the Commission, I worked for the Department of the Treasury, Internal Revenue Service, for 5-1/2 years as an Internal Revenue Agent, and in public accounting with a certified public accountancy firm.
I joined the Commission in 1985, and participated in financial and compliance examinations as well as performed a variety of financial analysis and advisory work in the former Commission Advisory and Compliance Division for three years. From 1988 to 1992 I was a part-time Lecturer of Accounting in the Department of Accounting, School of Business, at California State University, San Francisco. I joined ORA in 1988 and since then have worked on a variety of water, telecommunication and energy matters in general rate cases and other formal proceedings. I have served as the sole lead regulatory tax witness responsible for federal & state income forecasts and tax policy recommendations in general rate cases, advocated regulatory tax policy in other proceedings, as well as provided a variety of advisory work for other divisions within the Commission on matters related to Commission regulatory tax policy. I have been in the Water Branch since 2006, and participate in the analysis of test year expense forecasts and policy issues in general rate cases, policy issues in merger and acquisition applications, and a variety of other matters of Class A Water Companies.

Q.4 What is your area of responsibility in this proceeding?
A.4 I am responsible for the preparation of Chapter 5, Pensions & Benefits Expenses, Chapter 6, Taxes Other Than Income, Chapter 7, Income Taxes, and a Section in Chapter 14, Memo/Balancing Accounts related to Approval and Deposition of the 2010 Tax Act Memorandum Account.

Q.5 Does that complete your prepared testimony?
A.5 Yes, it does.
QUALIFICATIONS AND PREPARED TESTIMONY
OF
MUKUNDA DAWADI

Q1. Please state your name, business address, and position with the California Public Utilities Commission (Commission).

A1. My name is Mukunda Prasad Dawadi and my business address is 505 Van Ness Avenue, San Francisco, California. I am an Auditor I in the Communication and Water Policy Branch of the Office of Ratepayer Advocates (ORA).

Q2. Please summarize your educational background.

A2. I received a Master’s of Science in Accountancy from California State University, Los Angeles in 2012. I graduated from Tribhuvan University (TU) of Nepal in 1998 with a Master’s of Business Administration/Bachelor’s Degree in Business Management (Capital Structure and Accounting).

Q3. Please summarize your business experience.

Q4. What is your responsibility in this proceeding?

A4. I am responsible for the General Office Expenses excluding payroll and benefits (Chapter 12).

Q5. Does this conclude your prepared direct testimony?

A5. Yes, it does.
QUALIFICATIONS AND PREPARED TESTIMONY

OF

JULIA ENDE

Q.1. Please state your name, business address, and position with the California Public Utilities Commission (Commission).

A1. My name is Julia Ende and my business address is 505 Van Ness Avenue, San Francisco, California. I am a Public Utilities Regulatory Analyst in the Water Branch of the Office of Ratepayer Advocates.

Q2. Please summarize your education background.

A2. I graduated from Carnegie Mellon University with a Bachelor of Science Degree in Policy & Management.

Q3. Briefly describe your professional experience.

A3. In October 2013 I joined the Water Branch of the Commission’s Office of Ratepayer Advocates as a Public Utilities Regulatory Analyst working on General Rate Case proceedings. Prior to joining ORA, I worked at a law firm, taking part in negotiations between public agencies/non-profits and labor unions. My work also involved analyzing budget and class and comparability data and drafting proposals and full-text Memoranda of Understanding.

Q4. What is your responsibility in this proceeding?

A4. I am responsible for ORA’s testimony on Operating Revenues, Working Cash, Conservation, Rate Design, WRAM/MCBA Policy Changes and Special Requests #1, 2, 3, 4, 5 and 7.

Q5. Does this conclude your prepared direct testimony?

A5. Yes, it does.
QUALIFICATIONS AND PREPARED TESTIMONY
OF
SUNG HAN

Q. 1 Please state your name, business address, and position with the California Public Utilities Commission (Commission).

A. 1 My name is Sung B. Han and my business address is 505 Van Ness Avenue, San Francisco, CA. I am Senior Utilities Engineer in the Water Branch of the Office of Ratepayer Advocates (ORA).

Q.2 Please summarize your educational background.

A.2 I received a Bachelor of Science degree in Mechanical Engineering from San Francisco State University in 1970 and a Master’s of Science degree in Mechanical Engineering from University of California, Berkeley in 1972. I have taken various courses in financial accounting, regulatory economics, and depreciation from various institutions. I am also a licensed Professional Mechanical Engineer in the State of California.

Q.3 Please summarize your business experience.

A.3 After graduation from Berkeley, I joined the Commission. I worked on various formal proceedings before this Commission, including various types of rate proceedings, valuation studies and other investigations initiated by the Commission. I have analyzed and testified on various aspects of utility operations including plant, depreciation, operations and maintenance expenses, administrative and general expenses, revenues, rate design, and conservation. I have also worked as Project Manager for various energy and water rate proceedings.

Q.4 What is your responsibility in this proceeding?

Q.5 Does this conclude your prepared direct testimony?

A.5 Yes, it does.
QUALIFICATIONS AND PREPARED TESTIMONY
OF
ROY KEOWEN

Q1. Please state your name, business address, and position with the California Public Utilities Commission (Commission).

A1. My name is Roy Anthony Keowen and my business address is 505 Van Ness Avenue, San Francisco, California. I am an Auditor I in the Water Branch of the Office of Ratepayer Advocates (ORA).

Q2. Please summarize your educational background.

A2. I received a Bachelor’s of Science in Business Administration, Option in Accounting from California State University, Los Angeles in 2009.

Q3. Please summarize your business experience.

A3. I worked for 1 year as a tax-auditor for the California State Board of Equalization and 1 year as a part-time office manager for a small non-profit organization.

Q4. What is your responsibility in this proceeding?

A4. I am responsible for Chapter 14 covering AVR’s Balancing and Memorandum accounts including CARW Balancing Account, 2010 Tax-Act Memorandum Account, Credit-Card Memorandum Account, proposed Solar Project Memorandum Account, and proposed Chrome-6 Memorandum Account. I am also responsible for Chapter 13 regarding affiliated transactions, and non-tariffed products & services.

Q5. Does this conclude your prepared direct testimony?

A5. Yes, it does.
QUALIFICATIONS AND PREPARED TESTIMONY
OF
HERBERT MERIDA

Q1. Please state your name, business address, and position with the California Public Utilities Commission (Commission).

A1. My name is Herbert Merida and my business address is 505 Van Ness Avenue, San Francisco, California. I am a Public Utilities Regulatory Analyst in the Water Branch of the Office of Ratepayer Advocates.

Q2. Please summarize your education background and professional experience.

A2. I graduated from San Francisco State University, with a Bachelor of Science Degree in International Business Management, a minor in Economics, and a Master of Business Administration Degree. Regarding my professional experience, I have been employed by the Commission for more than four years and have worked on many general rate case proceedings. Also, I have held a variety of positions at Levi Strauss & Co., Siemens A.G., the Employment Development Department, the State Compensation Insurance Fund, and most recently the Commission.

Q3. What is your responsibility in this proceeding?

A3. As an expert witness, I am responsible for Administrative and General Expenses (except for Payroll and Employee Benefits) and the Result of Operations Tables.

Q4. Does this conclude your prepared direct testimony?

A4. Yes, it does.
QUALIFICATIONS AND PREPARED TESTIMONY
OF
JAMES SIMMONS

Q. Please state your name and business address.
A. My name is James J. Simmons. My business address is 505 Van Ness Avenue, San Francisco, California 94102.

Q. By whom, and in what capacity are you employed?
A. I am employed by the Public Utilities Commission of California (CPUC) as a Public Utilities Regulatory Analyst (PURA) V in the Office of Ratepayer Advocates (ORA).

Q. Please summarize your educational background and work experience.
A. I received a Bachelor of Science degree in Business Administration from the University of Maryland, College Park, with an emphasis in Accounting.

After graduation, I worked for six years for the West Virginia Public Utilities Commission (WVPSC), attaining the level of Senior Utilities Analyst in the Audit Office. My duties included investigation and the preparation of audit reports on water, electric, gas, and motor carrier public utilities regulated by the WVPSC, and testifying as a staff expert witness in rate setting proceedings before that Commission.

In November, 1984, I successfully passed the examination for Certified Public Accountant (CPA) and was awarded a CPA Certificate and License from the West Virginia Board of Accountancy in February, 1985.

I joined the staff of the CPUC in November 1985 in the Office of Ratepayer Advocates (ORA), initially employed in the class of Financial Examiner and later in the class of Public Utilities Regulatory Analyst (PURA), attaining the senior level of each. Here, I have participated in the financial examinations of major regulated public utilities, testifying in a position of ratepayer advocacy in investigations and proceedings before the CPUC. I have worked on the general rate cases (GRCs) of AT&T Communications, Pacific Bell, and General Telephone Company of California. I led a review of the affiliate transactions of Pacific Bell Directory, and I served as the ORA project manager of Roseville Telephone Company’s 1995 test year GRC.

From 1996 through 2000, I worked for the CPUC’s Telecommunications Office in the capacity of a senior PURA. My duties included: assisting administrative law judges and the Commission in the preparation of decisions; preparing resolutions; the review and processing of applications for certificates of public convenience and necessity of...
competitive local exchange telecommunications companies; and the review and processing of advice letters. There, I also served as the CPUC liaison to: the Universal Lifeline Telephone Service (ULTS) Marketing Board; the ULTS Administrative Committee; and the Community Technology Fund. My duties included oversight and all CPUC staff administrative functions for the ULTS program, including: review and processing of carriers’ ULTS claims, the preparation of budgets, contracts, and the Commission resolutions authorizing them.

Since April 2001, I have been employed in the CPUC’s Office of Ratepayer Advocates (ORA) as a senior PURA. My current duties include participation in major proceedings before the CPUC in a position of ratepayer advocacy.

In April, 2007, I successfully passed the examination for Certified Rate of Return Analyst (CRRA) administered by the Society of Utility and Regulatory Financial Analysts (SURFA) administered annually at Georgetown University in Washington, D.C.

I have testified before this Commission on many occasions.

Q. What is the purpose of your testimony today?

A. I have prepared and am sponsoring ORA’s Testimony on: ORA’s Testimony on Payroll Expenditures (Chapter 4) both for AVR and General Office and AVR’s Requests for Solar Project and Credit Card Memorandum Accounts (Chapter 14).

Q. Does that complete your prepared direct testimony in this proceeding?

A. Yes, at this time.
QUALIFICATIONS AND PREPARED TESTIMONY

OF

CLEASON WILLIS

Q.1. Please state your name, business address, and position with the California Public Utilities Commission (Commission).

A1. My name is Cleason Willis and my business address is 505 Van Ness Avenue, San Francisco, California. I am a Regulatory Analyst in the Water Branch of the Office of Ratepayer Advocates.
